This is a survey of Russian research and development in high-power microwave (HPM) sources. It emphasizes those sources of nanoseconds pulse duration time which have potential weapon as well as radar applications. It does not cover the whole range of Russian HPM research and development but concentrates on those aspects which may lead to military applications. Russian investigators have achieved many world firsts in HPM generation; for example, a multi-wave Cerenkov generator with a peak output power of 15 gigawatts. Their successes are based on their impressive capability in pulsed power technology which has yielded high-current generators of terawatt peak power. They have transformed the energy of these currents into microwave radiation using tubes of both conventional and novel designs exploiting relativistic electron beams. Recently, the development of high-current mini-accelerators has moved relativistic electron-beam (REB) HPM generation out of the laboratory and enabled the development of deployable military systems with peak powers in the gigawatt range. As a result, they now see development of a REB-

based radar systems as one of the most promising directions in radar systems. Details of such a system are described and the implications for HPM weapons are considered.

HIGH EFFICIENCY BACKWARD-WAVE OSCILLATORS FOR HIGH POWER MICROWAVE GENERATION: PRESENT STATUS AND FUTURE TRENDS

Schamiloğlu, E., New Mexico Univ., USA; Gahl, J., New Mexico Univ., USA; Fleddermann, C., New Mexico Univ., USA; Shiffler, D., New Mexico Univ., USA; Fleddermann, C., New Mexico Univ., USA; Shiffler, D., New Mexico Univ., USA; Moreland, L., New Mexico Univ., USA; Grabowski, C., New Mexico Univ., USA; Cavazos, T., New Mexico Univ., USA; Wroblewski, B., New Mexico Univ., USA; AGARD, High Power Microwaves (HPM), Volume 1; Mar 1, 1995, 7 p; In English Contract(s)/Grant(s): F49620-94-1-0087; F49620-93-1-0585; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

The efficiency of high peak power microwave generation in vacuum X-band backward-wave oscillators is described. Nonuniform slow wave structures are driven by the Sinus-6, a short pulse, repetitive relativistic electron beam accelerator. Peak microwave power exceeding 500 MW at 9.45 GHz has been measured in an 8 ns pulse. The corresponding beam-to-microwave power conversion efficiency was 17%, although efficiencies approaching 25% have been achieved at lower power levels. The ability to acquire a large amount of data using the Sinus-6 accelerator facilitates comparisons with electromagnetic particle-in-cell simulations and analytical theories. In a companion set of experiments, a modified PI-110A single shot electron beam accelerator is used to study backward-wave oscillators with parameters comparable to the Sinus-6 experiments, except at pulse durations approaching 0.5 microsecs. The goal of these studies is to extend the duration of microwave generation in high power backward-wave oscillators to several hundreds of nanoseconds. Technological innovations, such as ferroelectric cathodes and thin film metallic coatings, are expected to yield significant advances in long pulse operation.

APPLICATIONS OF RELATIVISTIC KLYSTRON AMPLIFIER TECHNOLOGY

Friedman, M., Naval Research Lab., USA; Serlin, V., Naval Research Lab., USA; Lampe, M., Naval Research Lab., USA; Hubbard, R., Naval Research Lab., USA; AGARD, High Power Microwaves (HPM), Volume 1; Mar 1, 1995, 9 p; In English; Sponsored by ONR; and BMDO-IST/HDL; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Over the past decade, development of the relativistic klystron amplifier (RKA) at NRL boosted high power microwave (HPM) technology by an order of magnitude. RKA has set world records in peak RF power generation. Using RKA's, microwave power in excess of 10 GW has been generated, at a frequency of 1.3 GHz and with energy of 1 kJ per pulse. Even though the NRL RKA constitutes a major advance over previous HPM technology, practical applications continue to be limited by size, cost and immobility of the equipment; relatively low efficiency (35%); breakdown at high power level, particularly in the output gaps; and unfavorable power scaling at frequencies above 1 GHz. However, we developed plans for a new generation of RKAs that will leapfrog all of these limitations, providing a technology with the following characteristics: (1) compact, cheap, and efficient; (2) avoiding gap breakdown; and (3) equally efficient from .5 to 10 GHz (greater than 75%).

INVESTIGATIONS INTO SUB-NS PULSE GENERATION USING FERRITE-LOADED COAXIAL LINES

Bolton, H. R., University Coll., UK; Dolan, J. E., University Coll., UK; Shapland, A. J., University Coll., UK; Parkes, D. M., Defence Research Agency, UK; Trafford, K., Defence Research Agency, UK; Kerr, B., Defence Research Agency, UK; AGARD, High Power Microwaves (HPM), Volume 1; Mar 1, 1995, 9 p; In English; Sponsored by Defence Research Agency; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Systems such as Pockels Cell drivers and UWB radar require electrical pulses of less than 200 ps rise-time and amplitude of 10 kV or greater into 50 ohms. Desired p.r.f.'s may be 50 kHz or higher in burst mode. The output rise-time of high power and p.r.f. capable pulsers is generally of the order 2-20 ns, and ferrite-loaded coaxial lines are one means of reducing the leading edge 10-90% rise-time to the order of 100-200 ps. The development of the fast-rising leading edge in ferrite lines is due to the non-linearity of the magnetic medium, and the consequent formation of an 'electromagnetic shock front' at the pulse leading edge. Over the past decade, the use of magnets to bias the ferrite has been found to improve output rise-time and amplitude characteristics considerably. Steady-state analyses made by Soviet analysts in the 1960's do not explain the magnet-biased ferrite line characteristics, and a numerical approach will be presented which shows how the microwave characteristics of the ferrite may be combined with the TEM transmission line equations to model electromagnetic shock wave propagation in such ferrite-loaded lines. It now appears reasonably clear that ferrite lines may be effectively modelled and designed in terms of parameters including the ferrite saturation magnetisation, and the dimensions of the line and the ferrite beads. Second order effects such as conductor and dielectric losses may also be taken into account if required.

VLSI IMPLEMENTATION OF A CHIP FOR A SYSTOLIC ARRAY ARCHITECTURE FOR DIRECTION FINDING SYSTEMS

Audone, B., GF-Sistemi Avionici, Italy; Bresciani, F., GF-Sistemi Avionici, Italy; Zerlotti, D., Modulo Uno, Italy; Remote Sensing: A Valuable Source of Information; Oct. 1996; 8p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Recently a new class of so-called subspace methods for high resolution direction finding has received a great deal of attention in the literature. In this paper a new processor designed for parallel filter structure (systolic array) is presented. The processor is a single chip VLSI implementation of an electronic board for systolic array which computes the QR, the SVD, and the generalized Schur decomposition

(GSD) of a complex matrix. The array utilizes coordinate rotation digital computer (CORDIC) arithmetic to perform the vector rotations and inverse tangent calculation in hardware. The resulting architecture is a two layer Jacobi array that can handle all the subproblems for solving direction finding problems. This component will be used for a direction finding system of advanced characteristics to be installed on airborne platforms. The main advantages of the high resolution technique consist in improved resolution (because it can overcome the limitations of the Rayleigh criterion) and in the possibility of detecting sources located in different positions and emitting signals at the same frequency.

A VISCOUS-INVISCID INTERACTION MODEL FOR ROTOR AERODYNAMICS

Filippone, A., Technical Univ. of Denmark, Denmark; Sorensen, J. N., Technical Univ. of Denmark, Denmark; AGARD, Aerodynamics and Aeroacoustics of Rotorcraft; Aug 1, 1995, 10 p; In English; See also 19960003572; Sponsored in part by CIRA S.p.A.; Copyright; Avail: CASI; A02, Hardcopy; A04, Microfiche

This paper presents a numerical model for viscous-inviscid interactive computations of rotor flows. The model presented is fairly general, as it allows for both steady and unsteady calculations. The basic methodology for deriving the outer inviscid solution is a fully three-dimensional boundary element method. The inner viscous domain, i.e. the boundary layer, is described by the two-dimensional Navier-Stokes equations. For the interactive procedure a blade strip approach is used. The outer inviscid solution provides the distribution of induced velocities to be used as boundary condition for the Navier-Stokes solver. The outer solution is then updated with new boundary conditions, arising from the viscous effects. For unsteady flow calculations a time marching procedure is used. Some preliminary results are presented for the rotor blade of a wind turbine.

MICRON-SIZED DROPLETS IRRADIATED WITH A PULSED CARBON DIOXIDE LASER: MEASUREMENT OF EXPLOSION AND BREAKDOWN THRESHOLDS

Armstrong, R. L., New Mexico State Univ., USA; Biswas, A., New Mexico State Univ., USA; Pinnick, R. G., Army Research Lab., USA; Pendleton, J. D., Army Research Lab., USA; AGARD, High Power Microwaves (HPM), Volume 1; Mar 1, 1995, 11 p; In English; Copy-

right; Avail: CASI; A03, Hardcopy; A03, Microfiche

We present the results of measurements of explosive vaporization and plasma breakdown thresholds of micron-sized droplets irradiated by a pulsed CO₂ laser operating at 10.6 microns. Well-defined explosion and breakdown patterns are observed when the incident laser intensity exceeds the threshold value. In the infrared region, the breakdown threshold is larger than the vaporization threshold by a factor of approximately 10(exp 2). Although, to the authors knowledge, no analogous measurements of vaporization and breakdown thresholds of individual aerosol particles exist in the microwave region, scaling of our infrared measurements to deduce the corresponding microwave properties is possible using available theoretical models. When this scaling is performed, it suggests that a dramatic reversal of explosion and breakdown thresholds occurs in the microwave region. In this region, the microwave vaporization threshold is larger than the corresponding breakdown threshold by a factor of greater than 10(exp 4). Recent measurements of breakdown thresholds in aerosol-laden air provide indirect evidence that this reversal has, in fact, taken place.

The Phillips Laboratory's Laser Effects Branch, PLW5AE, performs laser interaction experiments on a wide range of materials, components, and subsystems, to understand the physics of interaction at high heating rates and to explore for any synergistic phenomenology in components and subsystems. This paper covers one such recently completed project: Critical Heat Flux Panel Experiments. The goal of the Critical Heat Flux Panel Experiments is to determine the necessary threshold laser irradiance to induce film boiling on the inside surface of a fuel tank. Film boiling describes the phenomena whereby a thin continuous vapor layer is formed on the heated surface, such as the inside surface of a fuel tank, and effectively insulates the wall from the liquid within. Film boiling, once established, interferes with heat transfer by insulating the wall from the liquid, which allows laser energy to remain within the wall raising its temperature quickly to failure level. At heating rates below those required for film boiling, vapor bubbles form and detach continuously from the heated surface, a process referred to as nucleate boiling. This leaves both plenty of liquid in contact with the wall and actually stirs up the liquid providing massive heat transfer from the wall. Thus, nucleate boiling is a very effective heat transfer mechanism. The Critical Heat Flux Panel Experiments have successfully established laser irradiance thresholds for achieving film boiling and ultimate failure of a metal tank. This paper describes in detail test design and special procedures utilized for this test series. The paper also presents experimental results and its implications to theoretical models.

PARALLEL COMPUTERS AND PARALLEL ALGORITHMS FOR CFD: AN INTRODUCTION

Roose, Dirk, Katholieke Univ. te Leuven, Belgium; Vandriessche, Rafael, Katholieke Univ. te Leuven, Belgium; AGARD, Special Course on Parallel Computing in CFD; Oct 1, 1995, 23 p; In English; See also 19960009081; Avail: CASI; A03, Hardcopy; A03, Microfiche

This text presents a tutorial on those aspects of parallel computing that are important for the development of efficient parallel algorithms and software for computational fluid dynamics. We first review the main architectural features of parallel computers and we briefly describe some parallel systems on the market today. We introduce some important concepts concerning the development and the performance evaluation of parallel algorithms. We discuss how work load imbalance and communication costs on distributed memory parallel computers can be minimized. We present performance results

for some CFD test cases. We focus on applications using structured and block structured grids, but the concepts and techniques are also valid for unstructured grids.

LOAD BALANCING COMPUTATIONAL FLUID DYNAMICS CALCULATIONS ON UNSTRUCTURED GRIDS

Vandriessche, Rafael, Katholieke Univ. te Leuven, Belgium; Roose, Dirk, Katholieke Univ. te Leuven, Belgium; AGARD, Special Course on Parallel Computing in CFD; Oct 1, 1995, 26 p; In English; See also 19960009081; Avail: CASI; A03, Hardcopy; A03, Microfiche

Efficient use of a parallel computer requires the data and the operations that must be performed on them to be distributed over the processors in such a way that the work load is balanced and the communication cost minimized. This distribution problem is called the load balancing problem. For CFD applications, the load balancing problem amounts to finding a partition of the grid and subsequently a mapping of the subgrids to the processors, that balance the work load and minimize the communication costs. This tutorial contains a description of well-established methods for partitioning and mapping unstructured grids. They range from simple heuristics, over global optimization methods to very powerful and cost-effective algorithms that combine the strengths of simpler heuristics. Most of the methods that will be discussed, have been implemented in some well-documented and -supported partitioning tools. The tutorial discusses two of the most important ones: Chaco and TOP/DOMDEC.

Computer codes solving the Euler Equations have been used to calculate the flow around a series of non-circular store bodies at transonic Mach numbers. Where possible Navier-Stokes solutions have been compared with these results. Four different cross-sections have been considered which are formed by gradually transforming a square into a circle by rounding the corners. Each of the stores has a tangent ogive nose. Both the full three dimensional solutions around these stores and the two dimensional crossflow solutions have been investigated. The particular interest has been in the capability of Euler codes

to predict crossflow separation. The results obtained show that for some cases, Euler codes can provide an inexpensive alternative to Navier-Stokes codes for use as an initial design tool.

Store-carriage, pylon, fuselage interaction problem for modelling part of a fuselage of a fighter aircraft in low Mach number flight is studied by solving the full Navier-Stokes Equations numerically. A Finite Element Method (FEM) with an explicit time marching scheme is used for the solution. An artificial viscosity, equivalent of streamwise upwinding, is implemented while obtaining the velocity field. The pressure field is determined via an auxiliary potential function obtained with an accelerated iterative solution of Poissons' equation. Comparison of the pressure distributions and aerodynamic force coefficients obtained by the code for various test cases has validated the code. Therefore the code is utilized for more complex flow predictions.

A Computational Fluid Dynamics (CFD) technique based on a Vortex Lattice Method (VLM) is presented for treating the unsteady, low speed aerodynamics of a Wing/Fuselage/ Pylon/Store (W/F/P/S) combination in an incompressible flow. The main emphasis is placed on a practical, cost-effective engineering solution of the complex problem with a reasonable computational efficiency allowing the computer code to run on small personal computers. The computational model presented in this study enables the calculation of the unsteady aerodynamic forces acting on a wing system undergoing a time dependent three dimensional motion. An unsteady, wing following and wake shedding procedure provides the transient wake shapes. Computed flow field simulations are presented for various unsteady and angle of attack conditions involving pylon/store locations at various spanwise locations under the wing. The external store separation under the influence of the unsteady wake rollup behind the

wing system is modeled by considering the full mutual interaction between the store and the W/F/P configuration. The results show that the method is capable of simulating the important features of the unsteady forces and wake development behind the W/F/P/S configuration.

In order to avoid or minimize the fluctuating forces resulting from unsteady flow-structure interaction, one tries to identify the important parameters which affect the level of these excitations. A subsonic and transonic convergent/divergent nozzle is used to analyze the unsteady flow near sonic conditions. Analytical and numerical computations using unsteady linear and nonlinear Euler equations are carried out to analyze and quantify the upstream and downstream propagation of acoustic disturbances in the nozzle. The results show that, when the mean flow Mach number is close to unity, only upstream propagating acoustic disturbances are strongly amplified. It is therefore proposed to explain this phenomenon as resulting from the blockage of upstream propagating acoustic waves by near transonic mean flow. These results are confirmed on cascade configuration. A unsteady pressure bulge, near the sonic area, is found to be associated with the cut-on of a new acoustic mode in the upstream direction. The level of the pressure bulge is significantly reduced as a downstream propagating mode cuts on. These results confirm the phenomenon of acoustic blockage.

The compatibility between three dimensional simulations with Euler or Navier-Stokes equations, and through flow computations, may be satisfied by taking into account spatial fluctuation terms in the conservation equations of momentum and energy. This method has been little explored in order to determine the losses or work variations in a machine. A model for the computation of these spatial fluctuation terms is presented. The test of the model is performed for a steady flow in a low speed turbine cascade.

Current research on the structure of zero pressure gradient, flat plate turbulent boundary layers is reviewed. The behavior of boundary layers in subsonic and supersonic flow is discussed, with a particular emphasis on scaling laws with respect to Reynolds number and Mach number. For subsonic flows, it is shown that for the mean flow the classic arguments on inner and outer layer similarity hold extremely well over a large range of Reynolds numbers (approximately 350 less than or equal to $R(\sin \theta)$ greater than or equal to 210,000), and the overlap region is well established over the same region. In contrast, the Reynolds number can have a significant effect on the level of the maximum turbulence stresses, and the location of that maximum in the boundary layer. In particular, the streamwise scaling of the outer-layer is rather sensitive, where the scale increases with the Reynolds number. For supersonic flows with moderate Mach number, it appears that the direct effects of compressibility on wall turbulence are rather small: the most notable differences between subsonic and supersonic boundary layers may be attributed to the variation in fluid properties across the layer. However, certain characteristics cannot be collapsed by simple scaling. Among other observations, there exists strong evidence to indicate that the streamwise length scales are reduced significantly by increasing Mach number.

This paper presents a perspective on computational fluid dynamics (CFD) as a tool for aircraft design. It addresses the requirements for effective industrial use, and trade-offs between modeling accuracy and computational costs. Issues in algorithm design are discussed in detail, together with a unified approach to the design of shock capturing algorithms. Finally, the paper discusses the use of techniques drawn from control theory to determine optimal aerody-

namic shapes. In the future, multidisciplinary analysis and optimization should be combined to provide an integrated numerical design environment.

This paper analyzes the workings of the research engine and finds that it is encountering considerable strain. Resources for all elements of research are below historic levels. 'Money givers' are faced with a lack of metrics and infrastructure for telling them how to invest their resources except in high level terms. Leaders of research are having to redefine their jobs. Researchers are hunkered down to wait it out, and value systems are in disarray and conflict. The adaptation of the research engine to the changing world is far from complete. It is in transition. The paper goes on to describe what the author believes to be the principal characteristics and attributes of a well functioning research engine, together with a few personal experiences that shed some light on how those attributes can be achieved. He concludes that further adaptation of the research engine will be paced by two key factors. One is the need to change the types of communication that take place between the research community and the engineering community in industry. The other is the need to unshackle the minds of researchers from the imprisonment of an overly narrow value system, a task which must be led by the money givers who inhabit the research engine.

This paper presents an overview of parallel computing in computational fluid dynamics (CFD). A taxonomy of parallel computing architecture and programming paradigms is described. Issues in parallel computing are discussed including domain decomposition and load balancing, performance, scalability, benchmarks and portability. Examples of experience with parallel computing in the aerospace industry are described.

PORTABLE PARALLELIZATION OF A 3D EULER/NAVIER-STOKES SOLVER FOR COMPLEX FLOWS

Eisfeld, B., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Ritzdorf, H., Gesellschaft fuer Mathematik und Datenverarbeitung, Germany; Bleecke, H., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Kroll, N., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 12p; In English; See also 19960053167; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

This paper describes the portable parallelization of the FLOWer code, a large block structured computational fluid dynamics (CFD) solver for industrial use. Basic requirements for the parallelization are identified, and the strategies applied for its parallelization are

explained. Special emphasis is put on the parallel heart of the program, the communications library CLIC-3D. Results obtained on several platforms demonstrate the success of the method chosen and allow an assessment of today's capabilities of parallel computers in CFD applications. Parallel computations of aircraft configurations of varying complexity prove that parallel computers have become operational in aircraft development.

A PARALLEL SPECTRAL MULTI-DOMAIN SOLVER SUITABLE FOR DNS AND LES NUMERICAL SIMULATION OF INCOMPRESSIBLE FLOWS

Pinelli, A., Universidad Politecnica de Madrid, Spain; Vacca, A., Universidad Politecnica de Madrid, Spain; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 8p; In English; See also 19960053167; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

In the present paper we introduce and discuss an efficient parallel algorithm for the spectral multi-domain solution of incompressible Navier-Stokes equations. First, the algorithm is given in its basic form for the 2-dimensional case and, later on, a possible extension to 3-dimensional flows exhibiting a homogeneous (periodic) direction is proposed. The algorithm is validated both for its parallel performance and its accuracy.

ON IMPROVING PARALLELISM IN THE TRANSONIC UNSTEADY ROTOR NAVIER STOKES (TURNS) CODE

Wissink, Andrew M., Minnesota Univ., USA; Lyrintzis, Anastasios S., Purdue Univ., USA; Strawn, Roger C., Army Aviation Systems Command, USA; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 12p; In English; See also 19960053167; Contract(s)/Grant(s): DAAL03-89-C-0038; NSF CCR-94-96327; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

A parallel implementation of the three dimensional transonic unsteady rotor Navier-Stokes (TURNS) rotorcraft flow solver is studied. We investigate two modifications of the LU-SGS operator to improve parallel performance. The first is the Data-Parallel LU Relaxation (DP-LUR) technique. This operator uses a Jacobi sweeping procedure in place of the Gauss-Seidel sweeps in LU-SGS. The resulting algorithm is very amenable to parallel processing but requires significantly more computational work. The second approach is a hybrid technique which maintains the nearest neighbor communication patterns of DP-LUR but uses the more efficient Gauss-Seidel sweeps of LU-SGS for the on-processor computations. The TURNS code, with the DP-LUR and hybrid operators, is implemented on the massively parallel Thinking Machines using a multiple instruction/multiple data (MIMD) (i.e. requiring message passing) approach. The convergence qualities and the central processing unit (CPU) time of the two implicit operators are studied for an example calculation, comparing the quasi-steady three dimensional flow field around a helicopter blade with subsonic and transonic tip Mach numbers. Both the DP-LUR and hybrid modifications of LU-SGS show very good parallelism, and maintain the convergence rate of LU-SGS. However, the hybrid method uses less overall CPU time than DP-LUR.

The present article reports on further developments of an implicit coupled algorithm for fluid flow equations. Mass and momentum conservation equations are solved as part of one large system of equations in one simple step. Iterations are needed because of nonlinearities only. The algorithm requires no under-relaxation factors and can reach convergence in a reduced number of iterations, compared to decoupled approaches. This article describes improvements leading to reduction of both memory and computing time. The algorithm exceeds the memory requirements of the SIMPLE algorithm of Patankar and Spalding by a factor of $K(\exp 2)$, where K is the number of independent variables. Computing time reduction was achieved by using GMRES and a preconditioner based on incomplete LU factorization. The algorithm compares favorably with conventional de-coupled approaches. To overcome the high memory requirements and enable the simulation of large physical problems two different approaches for parallelization were also tested, at the expense of increased computing time.

In this paper, recent advances in the development of a new quadratic reconstruction finite-volume scheme for unstructured polygonal meshes are presented. The scheme is used to discretize the two-dimensional compressible Euler and full Navier-Stokes equations. The quadratic reconstruction is shown to lead to a full second-order accurate discretization of the advective derivatives. The accuracy of the scheme is very weakly dependent on grid distortions, a property which is very attractive for adaptive unstructured grids computations. The pseudo-time integration of the equations is performed by an implicit scheme based on Newton-Krylov techniques. The linear system that arises from the Newton linearization is solved by the GMRES algorithm. The incomplete LU factorization is employed for the system preconditioning. The accuracy, efficiency and robustness of the method are demonstrated on various classical test cases respectively corresponding to inviscid and viscous laminar flows.

The aim of this contribution is to present the first numerical results that we have obtained with a new second order kinetic theory based scheme. The main interest of our approach is that density and internal energy can be proved to remain non negative under a CFL like condition. It is well known that classical approximate Riemann solvers, even first order accurate, do not satisfy this property. Our first order scheme is the classical kinetic scheme, based on the Maxwellian velocity distribution. Our second order extension consists of adding to the first order numerical flux anti-diffusive correction which has to be limited such that the constraints of positivity will be satisfied. It can be seen as a variant of the so-called corrected anti-diffusive flux approach. We have performed numerical computations for various two and three dimensional test cases on unstructured and self-adaptive meshes, in order to evaluate the accuracy and the robustness of this new method. Comparisons have been done with a second order extension of Roe's scheme.

This paper describes the results of research carried out by the authors in the computer modelling of flow problems using an approximation based on 'clouds of points' which does not require the definition of a mesh. The so-called finite point method (FPM) is presented showing some examples for the solution of the one-dimensional convection diffusion equation and two dimensional compressible inviscid flows.

Solution algorithms for solving unsteady two dimensional Euler equations are presented. Cell centered upwind volume schemes are developed which utilize the two dimensional monotone linear reconstruction procedures. A new adaptive grid procedure is proposed to cluster the grid points in regions where they are most needed. This

procedure is generalized for unstructured grids. Numerical results in two dimensional cases are presented for linear and nonlinear convection problems.

AN INVESTIGATION OF THE EFFECTS OF THE ARTIFICIAL DISSIPATION TERMS IN A MODERN TVD SCHEME ON THE SOLUTION OF A VISCOUS FLOW PROBLEM

Briggs, R. D., Manchester Univ., UK; Shahpar, S., Manchester Univ., UK; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 12p; In English; See also 19960053167; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

In this work a total variation diminishing (TVD) artificial dissipation switching method similar to a matrix dissipation technique was studied. The switch is controlled by two parameters, the choice of flux limiter, and the value of the entropy correction parameter, which has an indirect effect. In order to study the effects of these terms we have considered a complex viscous flow problem, as further irregularities caused by artificial dissipation may present themselves in such a problem. An underexpanded jet interaction with a supersonic cross-flow has been chosen. This problem includes a separated boundary layer and regions of recirculation. The effect of the artificial dissipation terms on these flow phenomena have not been examined before. The objectives of the present study were to measure the effect of the artificial dissipation switching algorithm on the accuracy of the solutions produced for this test case. Also, a quantitative and qualitative examination of the amount of real viscosity compared with the artificial viscosity being added in the solution was included.

In this contribution, we present a multi-dimensional upwind scheme. In contrast to the flux vector of the flux-difference-splitting method, where an upwind operator is used before the residual is calculated, this scheme uses an operator on the discrete flux integration of flux balance and then assigns filtered parts of the residuals to the vertices of a cell. The so-called flux-filter operator will be derived subsequently on a one-dimensional basis to allow a stable updating. The scheme is linearly preserving and should therefore lead to an improved accuracy. The flux-filter scheme has been successfully implemented on the Euler and thin layer Navier-Stokes equations, for structured and unstructured grids. The unstructured grids are made of triangular and quadrilateral cells.

This paper reviews recent developments in multidimensional upwind schemes based on the residual decomposition or flux splitting approach. Unlike the standard finite volume approach, the upwind scheme is based on multidimensional physics, e.g. convection of entropy and total entropy along the streamline and convection of acoustic Riemann invariants along the Mach lines in steady supersonic flow. The resulting schemes on triangles and quadrilaterals are very compact, with stencils consisting of nearest neighbors only and can be made monotonic and second order, lie the total variation diminishing (TVD) schemes in finite volumes. Numerical examples show the improved performance compared to state-of-the-art methods. The paper further describes the introduction of convergence acceleration techniques which exploit the compactness of the stencils and the implementation of solution adaptive error control. The latter is based on scalar finite element a-posteriori error estimates which are applied to the Euler system in decoupled form thanks to the multidimensional residual decompositions.

Genuinely multidimensional upwind dissipation models are developed for the two- three-dimensional (2D/3D) Euler/Navier-Stokes equations using a cell-centered finite volume approach on structured grids. The numerical flux is formulated using the artificial dissipation concept. An overview is given for 2D/3D compact upwind dissipation for stencils up to 6 and 8 points respectively. A classification is set up for first and second order accurate schemes that have respectively minimum and zero cross diffusion. Second order monotone schemes are developed using the concept of non-linear limiter functions applied on multidimensional ratios of flux differences. A classification is presented for different families of 2D ratios. Three dimensional multidimensional limiters based on 3D ratios of flux differences are introduced. The scalar dissipation models are extended and applied to the Euler/Navier-Stokes equations based on a characteristic decomposition of the inviscid operator. The resulting characteristic compatibility equations consisting of convective and source terms are dependent on a set of 3 propagation directions. An overview is given for different choices of directions. The multidimensional discretization is considered for both the convective and source terms along its associated advective speed.

A second order accurate (both in time and space) explicit/implicit scheme is implemented for the solution of three-dimensional incompressible Navier-Stokes equations involving a high Reynolds number flow about complex configurations. A fourth order accurate artificial dissipation term on the momentum equations are used for stabilizing. A finite element method (FEM) with an explicit time marching scheme is used for the solution, and an element-by-element (E-B-E) technique is employed in order to ease the memory requirements needed by the

storage of the stiffness matrix of FEM. The cubic cavity problem, laminar flow past a sphere at a high Reynolds number and an incompressible viscous flow around the fuselage of a helicopter are successfully solved using the first and third order accurate schemes. A comparison of the results is also provided.

Chorin's method of artificial compressibility is extended to both compressible and incompressible fluids by using physical arguments to define artificial fluid properties that make up a local preconditioning matrix. In particular, perturbation expansions are used to provide appropriate temporal derivatives for the equations of motion at both low speeds and low Reynolds numbers. These limiting forms are then combined into a single function that smoothly merges into the physical time derivatives at high speeds so that the equations are left unchanged at transonic, high Reynolds number conditions. The effectiveness of the resulting preconditioning procedures for the Navier-Stokes equations is demonstrated for a wide speed and Reynolds number ranges by means of stability results and computational solutions. Nevertheless, the preconditioned equations sometimes fail to provide a solution for applications for which the non-preconditioned equations converge. Often this is because the reduced dissipation in the preconditioned equations results in an unsteady solution while the more dissipative non-preconditioned equations result in a steady state. Problems of this type represent a computational challenge; it is important to distinguish between non-convergence of algorithms, and the non-existence of steady state solutions.

PRACTICAL ASPECTS OF KRYLOV SUBSPACE ITERATIVE METHODS IN CFD

Pulliam, Thomas H., NASA Ames Research Center, USA; Rogers, Stuart, NASA Ames Research Center, USA; Barth, Timothy, NASA Ames Research Center, USA; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 12p; In English; See also 19960053167; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Implementation issues associated with the application of Krylov subspace iterative methods, such as Newton-GMRES, are presented within the framework of practical computational fluid dynamic (CFD) applications. This paper categorizes, evaluates, and contrasts the major ingredients (function evaluations, matrix-vector products, and preconditioners) of Newton-GMRES Krylov subspace methods in terms of their effect on the local linear and global nonlinear convergence, memory requirements, and accuracy. The discussion focuses on Newton-GMRES in both a structured multi-zone incompressible Navier-Stokes solver and an unstructured mesh finite-volume Navier-Stokes solver. Approximate versus exact matrix-vector products, effective preconditioners, and other pertinent issues are addressed.

This paper discusses a new numerical method which enables the future application of large eddy simulation to high Reynolds number aerodynamic flows. The new numerical method uses local grid refinement of hexahedral cells and the discontinuous Galerkin finite element method. This method offers maximum flexibility in grid adaptation and maintains accuracy on highly irregular grids. The method is demonstrated with calculations of inviscid transonic flow on a generic delta wing. The calculations are done on two parallel shared memory computers and the performance results are used to give estimates of the computing time and memory requirements for a large eddy simulation of a clean wing on a NEC SX-4 supercomputer.

We indicate that the use of higher order accurate spatial discretization is necessary to obtain sufficiently accurate direct numerical simulation (DNS) for the validation of subgrid models in large eddy simulation (LES). Furthermore, we pay attention to the efficiency of the implementation of these discretizations on several parallel platforms. In order to illustrate this, we consider compressible flow over a flat plate. We give a-priori test results for LES of this flow.

A versatile and effective numerical code for direct and large eddy simulations of compressible flows is described. It is based on robust explicit finite difference methods which are second-order accurate in time and fourth-order accurate in space. An industrial application is presented with comparison to a more fundamental case, tackled with spectral and compact schemes.

Structured sub-block refinement is a means to define a mesh at certain areas with the flow region, in order to enhance the local resolution of the flow equations or flow solution with going to costly global mesh refinement. by the use of appropriate sensors, the regions of refinement can be defined during the running flow solving process so that the adaptation becomes automatic. and the use of structured refinement, i.e., refinement by blocking areas, does only require minor changes to the overall multi-grid iteration scheme. Strategies for the selection of sub-blocks and first results for 2D and 3D Euler- and Navier-Stokes test cases are given. The drawbacks and potential of the method are described.

MULTIBLOCK STRUCTURED GRID ALGORITHMS FOR EULER SOLVERS IN A PARALLEL COMPUTING FRAMEWORK

Sibilla, Stefano, Aeromacchi S.p.A., Italy; Vitaletti, Marcello, IBM Italia, Italy; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 12p; In English; See also 19960053167; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Specific algorithms have been developed for numerical solution of Euler equations or multi-block structured grids of general topology; these algorithms involve determination of convective and dissipative fluxes, residual collection from fine grid levels during multigrid cycles and time step evaluation. They must be properly integrated with residual and flow variable averaging when the internal boundary condition is introduced. The influence of block subdivision on the bow-shock in front of a blunt-nosed body is analyzed with different multi-block algorithms: a structured and a locally unstructured topology are also compared. Results show that no additional error is introduced in multiblock solutions if internal block boundary conditions are applied at each stage and edge/corner boundary cell contributions to flow quantities are properly taken into account.

We present three developments which have been introduced in the code FLU3M. A numerical method for solving the unsteady Euler equations with time-varying rigid grids is first studied; it uses the van Leer scheme together with a second order in time implicit algorithm. A bi-dimensional nozzle and an afterbody shape have been calculated with the Jones-Lauder k-epsilon model, the implementation of which in the code is described for one and two species gases. Then a new implicit algorithm is shown; the DDLU factorization enables a reduction both in central processing unit (CPU) time and in memory requirements against the ADI factorization.

A three dimensional finite volume scheme is presented based on the use of hybrid grids, containing tetrahedral as well as prismatic cells. The application of hybrid grids offers the possibility to combine the flexibility of tetrahedral meshes with the accuracy of regular grids. An algorithm to compute an auxiliary grid of control volumes for the entire computational domain was formulated. The dual mesh technique guarantees conservation in the entire flow field even at interfaces between prismatic and tetrahedral domains and enables the employment of an accurate upwind flow solver. Convergence to the steady state can be accelerated by a multigrid algorithm based on the agglomeration of control volumes. The formulation of such an algorithm is presented.

A computational method for the simulation of rocket stages separations under aerodynamic and propulsive loads is presented. to simulate the motion of bodies, a conservative overlapping grid technique is used. The flow solver is based on a cell centered finite volume formulation on unstructured grids (made of tetrahedra, prisms, and hexaedra). The Euler equations with mixing gases are solved through a second order upwind scheme using the Godunov algorithm to compute the numerical fluxes. to integrate equations in time, a temporal adaptive algorithm is used since the real duration of the simu-

lated phenomena is long. It saves computer time and leads to accurate simulation of unsteady phenomena like acoustic waves and shocks displacements.

Recent progress in flux vector splitting is reviewed with the aim to obtain high resolution and robustness for hypersonic reacting flow simulations. The numerical behavior of promising AUSM and CUSP discretization variants is reported and compared. These schemes can be combined with explicit multistage time stepping and multigrid. Large chemical source terms introduce stiffness into the system of equations which is removed by point implicit treatment. The results demonstrate that efficient 3D simulation of viscous reacting flows with large contrast generated by strong shocks are now feasible.

This paper presents a hybrid upwind splitting method fully adapted to viscous chemical and thermal nonequilibrium flows. Such flows are the site of strong viscous-inviscid interactions and are dominated by real gas effects due to dissociation and internal mode excitation. Furthermore, the hyper-velocities along the reentry trajectory induce a larger degree of thermo-chemical non-equilibrium. ONERA has developed a code for simulating such flows: the code CELHYO. Detailed works concerning the physical modeling having already been presented in previous papers, the emphasis here is on the numerical method, and particularly on the extension of hybrid upwind splitting methods to non-equilibrium flows. The hybrid upwinding is achieved by combining the basically distinct flux vector and flux difference splitting approaches in retaining their own interesting features. The hybrid method implemented in the code CELHYO has been obtained by hybridizing the Osher approach with the van Leer scheme. In order to illustrate the numerical methods, internal and external flow configurations are presented.

A PROJECTION METHODOLOGY FOR THE SIMULATION OF UNSTEADY INCOMPRESSIBLE VISCOUS FLOWS USING THE APPROXIMATE FACTORIZATION TECHNIQUE

Pentaris, A., National Technical Univ., Greece; Tsangaris, S., National Technical Univ., Greece; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 14p; In English; See also 19960053167; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

In this paper, an implicit projection methodology for the solution of the two-dimensional, time dependent, incompressible Navier-Stokes equations is presented. The basic principle of this method is that the evaluation of the time evolution is split into intermediate steps. The computational method is based on the approximate factorization technique. The coupled approach is used to link the equations of motion and the turbulence model equations. The standard k-epsilon turbulence model is used. The current methodology, which has been tested extensively for steady problems, is now applied for the numerical simulation of unsteady flows. Several cases were tested, such as plane or axisymmetric channels, a backward facing step, and a flow behind a square cylinder.

ADAPTION BY GRID MOTION FOR UNSTEADY EULER AERO-FOIL FLOWS

Allen, C. B., Bristol Univ., UK; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 10p; In English; See also 19960053167; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

A solution-adaptive structured grid technique is described for the computation of steady and unsteady Euler flows past airfoils. Transfinite interpolation is used to generate the grids as this is well-suited to unsteady flows, since grid speeds required in the flux terms are available directly from the algebraic mapping. A novel approach to grid adaptation is described. Adaptation is performed by adapting the interpolation parameters, instead of the physical grid positions, so the adapted grid positions are available algebraically. Hence, the grid speeds required for unsteady computations are also available algebraically. For unsteady flows grid adaptation is performed by imposing an 'adaptation velocity' on grid points, thereby applying the adaptation gradually over several time steps and avoiding the interpolation of the solution from one grid to another, associated with instantaneous adaptation. Steady and unsteady airfoil flows are considered. In both cases the adaptive grid technique is shown to produce sharper shock resolution for a very small increase in central processing unit (CPU) requirements.

ADAPTIVE COMPUTATION OF UNSTEADY FLOW FIELDS WITH THE DLR-TAU-CODE

Friedrich, O., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Hempel, D., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Meister, A., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Sonar, Th., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Progress and Challenges in CFD Methods and Algorithms; Apr. 1996; 12p; In English; See also 19960053167; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

The features and abilities of the DLR-tau-code, a finite volume approximation of box type for the Navier-Stokes equations governing viscous, compressible fluid flow, are described in detail. The code is able to compute flow in moving reference frames and is built upon dynamic adaptive concepts to allow for grid refinement in the frame-

work of non-stationary aerodynamics. Implicit as well as explicitly time-stepping schemes can be used depending on the kind of application.

A code to calculate unsteady aerodynamic loads on non-uniformly moving 3D isolated wings has been prepared. The Euler equations are solved by means of a time-accurate finite volume method with second order central spatial discretization and Runge-Kutta time integration. The code has been implemented in a parallel supercomputer. The numerical scheme used together with some representative results are presented.

VISCOUS/INVISCID AND REAL-GAS EFFECTS ASSOCIATED WITH HYPERSONIC VEHICLES

Holden, Michael S., Calspan-Buffalo Univ. Research Center, USA; Aerothermodynamics and Propulsion Integration for Hypersonic Vehicles; Oct. 1996; 82p; In English; See also 19970009247; Copyright Waived; Avail: CASI; A05, Hardcopy; A04, Microfiche

In this segment of the lecture series, we discussed some of the important effects of viscous/inviscid interaction and real gas phenomena on the design and performance of hypersonic vehicles. Following a general review of the importance of such effects on vehicle design and performance, we discuss the effects of non-equilibrium and real-gas flows with emphasis on their importance to the accurate simulation of hypervelocity flows in ground test facilities. Because boundary layer transition exerts a dominant influence on vehicle performance in a hypersonic flow regime, we briefly review some of the key phenomena which control boundary layer transition in regions of adverse pressure gradient crossflow and along the attachment line of swept leading edges. For it is such phenomena, where it is currently believed that experimental measurements in hypersonic ground test facilities are of relevance. The key phenomena associated with shock-wave/boundary layer interaction for both laminar and turbulent, two- and three-dimensional flows are briefly reviewed and compared with the most recent prediction techniques. The aerothermal loads and flowfield phenomena associated with regions of shock/shock interaction are then discussed with particular emphasis on the effects of boundary layer transition and low-density flows on the magnitude of the peak heating in regions of Type 3 and 4 interactions. Film and transpiration cooling must be employed to cool the internal components of high performance scramjet engines. Correlations are presented to show the effectiveness and relative effectiveness of film and transpiration cooling both with and in the absence of shockwave/boundary layer interaction. The aerothermal and aero-optical performance of seeker-heads for hypersonic interceptors represents currently one of the most key areas in hypersonic technology. The techniques that are being employed to obtain measurements of the aerothermal and aero-optical performance in the LENS facility are briefly reviewed. Finally, we present information on the 'CUBDAT' database of hypersonic measurements which have been assembled from fundamental studies of the phenomena discussed in this segment of the lecture series.

CFD has played a major role in the resurgence of hypersonic flight, on the premise that numerical methods will allow us to perform simulations at conditions for which no ground test capability exists. Validation of CFD methods is being established using the experimental data base available, which is below Mach 8. It is important, however, to realize the limitations involved in the extrapolation process as well as the deficiencies that exist in numerical methods at the present time. Current features of CFD codes are examined for application to propulsion system components. The shortcomings in simulation and modeling are identified and discussed.

Recent experimental work in the area of compressible turbulent free shear layers is reviewed. Results for the canonical two-stream, constant-pressure shear layer are given. Emphasis is placed on growth rate, turbulence statistical quantities, large-scale turbulent structure, and growth rate enhancement. Compressible free shear layers present in high-speed separated flows are also considered. Here, results on mean flow, turbulence statistics, and large turbulent structures are discussed. Additional effects in these separated flows,

such as the expansion that may occur at separation and the bulk compression, streamline curvature, and lateral streamline convergence that may occur at reattachment, are discussed. In order to develop a sound physical understanding of these compressible turbulent flows, particular attention is given to single-frame and multiframe planar imaging studies.

LARGE-EDDY SIMULATIONS OF COMPRESSIBLE TURBULENT FLOWS

Lesieur, M., Institut de Mecanique de Grenoble, France; Comte, P., Institut de Mecanique de Grenoble, France; *Turbulence in Compressible Flows*; Jun. 1997, 4.1-4.39; In English; See also 19970021641; Sponsored in part by Institut Universitaire de France Contract(s)/Grant(s): ONERA-22.492/DA/A1.CC1; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

In the first lecture, we describe the general framework of large-eddy simulations (LES) applied to incompressible flows, with Smagorinsky's model. Afterwards we concentrate on LES from a spectral-space point of view. We introduce Kraichnan's spectral eddy-viscosity, and how it can be handled for LES purposes in isotropic turbulence, in terms of the plateau-cusp model. We generalize the spectral eddy viscosity to a spectral eddy diffusivity. Using the nonlocal interaction theory, we discuss the backscatter issue, and present a generalization of spectral eddy coefficients allowing to account for non-developed turbulence in the subgrid scales, the spectral-dynamic model. Applications of this model to a channel flow will be given, with comparisons with DNS, experiments, and the classical dynamic model. The latter will be presented and discussed. The second lecture will be devoted to the action of compressibility upon free-shear and separated flows. We will work in physical space. We will first present the structure-function model (SSF), the filtered SSF, and the selective SSF, as well as a version of the spectral-dynamic model in physical space, in terms of a combination of the structure-function model and a hyperviscosity. Afterwards, we will justify the use of an essentially incompressible subgrid-modelling for LES of compressible turbulence. Then, we will look at the effects of compressibility upon coherent vortices in mixing layers, and see in particular how helical pairing is inhibited above a convective Mach number of 0.7. We will consider also a round jet, and finally a separated flow in a configuration related to ARIANE V solid-propellant boosters. In the third lecture, we will concentrate on LES of compressible boundary layers. First, we will look at a weakly compressible boundary layer ($M(\infty) = 0.5$) spatially developing upon an adiabatic flat plate. Afterwards, we will consider a temporal boundary layer at Mach 4.5, and show how LES allow to describe the whole process of transition to turbulence. Finally, the structure of turbulence in the neighborhood of HERMES space shuttle's rear flap at Mach 2.5 will be examined.

The paper assesses the capability for numerical simulation of compressible turbulent flows using the Reynolds-averaged Navier-Stokes equations. The governing Favre-averaged equations are derived, and the various levels of turbulence models defined. Examples of zero, one-equation, two-equation and Reynolds Stress Equa-

tion turbulence models are presented. Specific results are discussed for boundary layer and free shear flows. Conclusions regarding future work are presented.

Validation of CFD methods is an ongoing process and it strongly depends on an assessment of flow-physics models employed in this process. On the basis of reliable numerical methods whether they are of boundary layer type or thin-layer or full Navier-Stokes approaches, predictive capabilities of turbulence models have to be validated in order to achieve accurate answers on the simulation of complex flow phenomena. Results are presented and discussed for two-dimensional and three dimensional flow cases and for a variety of turbulence models that are nowadays in use in the field of aeronautics and, more specifically, in the aeronautics industry. Moreover, some aspects of transition region modeling, hence enabling in general a continuous growth of turbulence - in contrast to merely 'switching on' the desired eddy-viscosity turbulence model 'abruptly' - are discussed. Additionally, attention is paid on problems related to accuracy and efficiency of a proper validation of turbulence models and numerical methods.

This report presents the results of a multinational effort to reflect the state-of-the-art for the accurate measurement of massflow and thrust. The accurate measurements of these quantities is essential to the success of windtunnel tests supporting engine-airframe aerodynamic integration studies. It is concluded that the measurement of gaseous mass flows with $\pm 0.1\%$ or better is still very difficult. For most test cases, however, with reasonable care, bias and random errors can be kept within $\pm 0.1\%$ respectively. For thrust measurements, these values must typically be doubled. This report presents the results of work conducted by Working Group 19 of the AGARD Fluid Dynamics Panel.

When a vehicle is entering atmosphere at very large speeds, typically more than 4000 m/s, the mixture of gas which surrounds the body is heated by compression mechanisms at its front, and by friction inside the boundary layer. The temperature gradients are strong enough to induce some large energy transferred through the wall. One has to characterize the stiffness of this environment by the heat flux, an hypothetical wall at arbitrary temperature will receive, when isolated from the surrounding flowfield. This heat flux is depending on the velocity, altitude, shape geometry, and local point to be considered. For a ballistic re-entry body, which has a drag force quite small with respect to its weight, large velocity values are achieved until low altitude where density is rather high. The heat fluxes could reach values up to several hundred of MW/sq m, for an isolated wall. None material can resist to such heating. So, it needs the use of ablative materials, which disappear by means of physico-chemical processes with air.

THE SWIMMING HYDRODYNAMICS OF A PAIR OF FLAPPING FOILS ATTACHED TO A RIGID BODY

Bandyopadhyay, Promode R., Naval Undersea Warfare Center, USA; Donnelly, Martin J., Virginia Polytechnic Inst. and State Univ., USA; High Speed Body Motion in Water; Feb. 1998; 17p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A03, Hardcopy; A01, Microfiche

Inspired by the natural action of flapping in aquatic locomotion, a dual flapping foil device was developed. The performance of the device in providing propulsive and maneuvering forces to small rigid axisymmetric bodies will be detailed. Two modes of flapping were investigated: waving and clapping. The clapping motion of wings is a common mechanism for the production of lift and thrust in the insect world, particularly in butterflies and moths. Waving is similar to the motion of the caudal fin of a fish. A model was built (1 m long, 7.6 cm diameter) with flapping foils at the end of the tail cone and various measurements were performed in a water tunnel. (In hindsight, the model can be described as a rigid bodied mechanical seal because seals have remarkably similar dual flaps in their tails.) Time-dependent tests of thrust, drag, and yawing moment were conducted for several flapping frequencies commonly observed in relevant aquatic animals. Phase-matched laser Doppler anemometry measurements of the near wake were carried out and detailed vorticity-velocity vector maps of the vortex shedding process have been obtained for the axial and cross-stream planes. Dye visualization of wake was documented and

a video recording was prepared of the entire dynamic process. The ability of the dual flapping foil device to produce a net thrust and maneuvering cross-stream forces has been demonstrated, although the main body is rigid. Its wake, which is composed of jets, is extremely wide, nonrotating, and rapidly decaying. The thrust production greatly increases with Strouhal number. The results have been compared with two dimensional inviscid flapping foil theories and measurements. The effect of the rigid cylinder on the flapping performance is extracted. The efficiency of thrust production generally increases in the waving mode which mimics the side-to-side head motion of a fish. Efficiency also tends to peak roughly in the Strouhal number range popular among fish. Axial thrust shows sensitivity to Strouhal number in the range popular among fish. However, existing non-linear inviscid theories do not capture this aspect and the strong viscous effects observed also need to be included.

SUBSTITUTION OF ROLLING FOR SLIPPING AS AN EFFECTIVE MECHANISM OF DECREASING HYDRODYNAMIC DRAG

Merkulov, V. I., Institute of Theoretical and Applied Mechanics, Russia; High Speed Body Motion in Water; Feb. 1998; 3p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

As is shown by theoretical and experimental research, the general mechanism of crucial reduction of hydrodynamic drag consists in substituting rolling friction for slipping friction. This mechanism is realized at a boundary layer reconstruction with formation of periodic transverse vortices that are rolling without slipping over the body surface. A small velocity gradient characterizing such a motion results in low energy dissipation. A traveling wave on an elastic body surface works as a mechanism for formation of a periodic vortex structure for some water animals, such as dolphins. At appropriate elastic parameters of the surface, the wave is excited in a regime of hydroelastic flutter. The surface roughness, as it takes place with sharks, expands the range of velocities at which traveling waves are excited, though it decreases their energy efficiency.

General principle of optimization of alive organism consists, as a result of many-centuries evolution, in attainment of minimal energy expenditures for maintaining the process of life. Principal attention in this investigation is paid to study of peculiarities of organism systems and their interaction in the process of motion of water animals, which are directed at the reduction of energy expenditures. On dolphin example, considered are peculiarities of morphology and physiology of skeleton, muscles, skin coating, blood system and innervation. As the motion takes place in the water medium, considering those systems the force influence of medium onto the organism is taken into account. Studied are influence of swimming speed, non-steadiness of flow, unusual method of thrust creation, and specific structure of body surface onto the body systems. Also considered are some peculiarities of hydrodynamic influence onto the body when moving in water medium. In accordance with these peculiarities, specific structures of mentioned systems of water animals are analyzed. Here, there are detailed descriptions of skeleton and location of innervation ganglions as well as layer-by-layer location, along diameter and body length, of moving muscles. Structure of skin coatings is given in detail especially. The peculiarities of blood system and structure of that in skin coating are analyzed. Presented are results of measurements of temperature distribution on the surface of body skin and results of theoretical estimation of controlled heat conductivity of skin, by means of apparatus developed, the measurements of distribution for elasticity and damping properties of skin of different dolphin types are carried out. Presented are results of direct and indirect measurements of other

mechanical parameters of skin, in particular phase velocity of disturbances development. The results of measurements of turbulent boundary layer in different regimes of dolphin motion are given. Described are the functioning of body systems and mechanisms for regulation of mechanical features of skin. The ways of reduction of body motion drag are shown.

TURBULENT BOUNDARY LAYER OVER A COMPLIANT SURFACE

Voropaev, G. A., Academy of Sciences of the Ukraine, Ukraine; Rozumniuk, N. V., Academy of Sciences of the Ukraine, Ukraine; High Speed Body Motion in Water; Feb. 1998; 11p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Numerical results of modeling of turbulent boundary layers over deformable viscoelastic surfaces are presented. A qualitative interpretation of friction drag reduction on a deformable surface is given. Quantitative characteristics of interaction of a turbulent boundary layer with the deformable surface at various magnitudes of parameters describing viscoelastic properties of the material are obtained.

DISTINCTIVE FEATURES OF THE WAVE PLATE (OR FISH) MOTION

Korennyaya, L. I., Academy of Sciences of the Ukraine, Ukraine; High Speed Body Motion in Water; Feb. 1998; 9p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The measurements of the thrust force of the wavelike deformable plate in three-dimensional flow were carried out on specially constructed equipment. The laws which were found out by other authors in research of water animals (fish and dolphins) were reviewed. The vortical model of the wave-like deformable plate reflects three dimensional flow space. This model was used to calculate the hydrodynamic forces and coefficients of the wave-like deformable plate (the mechanical model of wave propulsion). Our measurements, calculations, comparisons with ideal hydraulic propulsion have shown the distinctive features of the wave-like deformable plate as it creates the thrust force. The distinctive features of boundary layer formation on the wave-like deformable body are also considered. There is a boundary layer control system in nature with running waves. Concepts similar to Prandtl's about boundary layer control by means of the moving surface of the body has existed in nature for centuries.

The structure of a numerically simulated turbulent boundary layer over a flat plate at $Re(\theta) = 670$ was studied using the invariants of the velocity gradient tensor (Q and R) and a related scalar quantity, the cubic discriminant ($D = 27R(\exp 2)/4 + Q(\exp 3)$). These invariants have previously been used to study the properties of the small-scale motions responsible for the dissipation of turbulent kinetic energy. In addition, these scalar quantities allow the local flow patterns to be unambiguously classified according to the terminology proposed by Chong et al. The use of the discriminant as a marker of coherent motions reveals complex, large-scale flow structures that are shown

to be associated with the generation of Reynolds shear stress - $u'v'$ (bar). These motions are characterized by high spatial gradients of the discriminant and are believed to be an important part of the mechanism that sustains turbulence in the near-wall region.

Boundary layer in natural conditions is influenced by disturbances of different types coming from outside. An approach was developed for experimental study of disturbance interaction. It was realized using a special hydrodynamic complex including a water channel with the regulated freestream turbulence level, different kinds of strain gauges and devices for the introduction of small disturbances into a boundary layer from its outer and inner edges. There were used in experiments visualization methods (in particular, tellurium method) thermo- and laser-anemometry and strain-gauging. Besides, a technique was developed to carry out measurements of space-time characteristics of disturbing motion. Kinematic, spectral and correlation characteristics were investigated at different stages of natural boundary layer transition including the turbulent state on flat and concave plates. The model of disturbance transformation through all the transition stages was proposed. Each stage was considered from the point of view of mechanisms driving the disturbance development resulting in the next stage. Some empirical relations were obtained for wave lengths of two and three-dimensional disturbances depending on the Reynolds number. Conditions of the occurrence of two transition types and their connection with two distinct intermittency factors proposed were analysed. Results were presented in the form of profiles of mean and fluctuation longitudinal velocity components and also of neutral curves and curves of maximum amplification in Tollmien-Schlichting and Goertler diagram. Structural and kinematical-dynamical principles of boundary layer interaction with compliant surfaces were formulated. Interactions of different disturbances were studied in boundary layers on resonant and dissipative compliant plates.

MODELING OF TURBULENT NEAR-WALL SHEAR FLOW PROPERTIES

Movchan, V. T., Kiev Univ., USSR; Shkvar, E. A., Kiev Univ., USSR; Feb. 1998; 7p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The given paper deals with mathematical and numerical modeling of shear flows in the vicinity of a boundary layer. The half-empirical algebraic models of turbulent viscosity and turbulent conductivity coefficients for predictions of two- and three-dimensional gradient flows on smooth and rough surfaces are proposed. These models of turbulent exchange coefficients can be effectively applied both for approximate analytical and numerical solutions of flow charac-

teristics on fixed or moving surfaces. The results of approximate analytical and numerical predictions of different kinds of boundary layers are presented.

A local approach that can be applied for investigation of near-wall flows, jets, and wakes is discussed. The approach is developed on the basis of examining the flow near a flat plate. Coupled equations, which describe both slow and fast changes of flow in longitudinal coordinates, are utilized. Possible ways of excitation of slow disturbances are studied. Direct numerical simulation (DNS) of near-wall flow is carried out. Phase speeds of propagation of 2D-disturbances are calculated.

A NEW APPROACH TO THE STUDY OF ORGANIZED VORTICAL MOTION AFFECTED BY BODY FORCES

Nikiforovich, Eugene I., Academy of Sciences of the Ukraine, Ukraine; Feb. 1998; 9p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Investigations under centrifugal forces transitional boundary layers as well as the spatio-temporal properties of boundary layer vortical structures is one of the major research areas of the Department of Thermal and Hydrodynamical Modeling of Hydromechanics Institute of Ukrainian National Academy of Sciences. It has been shown that in case of boundary layer flows under centrifugal forces the small parameter depending on the value of these forces can be introduced. Using methods of matching asymptotical expansions the scenarios of the boundary layer development (including transition processes from 2D to 3D) in terms of space scales of their vortical structures have been proposed. In particular, the knowledge about (1) formation mechanisms of 3D vortical structures in boundary layers; (2) spatio-temporal properties of 2D and 3D vortical structures depending on basic flow parameters were obtained.

EXPERIMENTAL STUDIES ON THE BOUNDARY LAYER DEVELOPMENT IN PENGUINS: MECHANISMS OF TURBULENCE CONTROL AND THEIR APPLICABILITY TO ENGINEERING

Bannasch, R., Technische Univ., Germany; Feb. 1998; 3p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

Experimental studies conducted on live penguins as well as measurements with life-sized models of their trunk in a water tank revealed extremely low drag coefficients, although there was some evidence that transition from laminar to turbulent near-wall flow occurred in the most frontal part of their body. At a Reynolds number of 3×10^6 (exp 6) the drag coefficients were 20-35% lower than those reported for the best turbulent technical bodies. Contrary to fish and dolphins, the penguin's trunk does not contribute to thrust production. Trunk oscillations during a wing beat cycle are moderate. Therefore, the spindle-like penguin trunk may well serve as live example for how energy may be saved by shape optimization of stiff bodies. The trunk of these birds is relatively short and thick, thus offering a large volume with minimum drag. Using the arithmetic means of data on body geometry from three medium sized penguin species, an axisymmetric body was constructed. by drag measurements in a water tank, this body of

revolution was found to be an excellent low-drag laminar body (e.g. the lowest frontal drag coefficient was $c_{(sub\ wf)} = 0.0156$, measured at $Re_{(sub\ D)} = 2,331 \times 10^6$ (exp 5). When the transition from laminar to turbulent flow was triggered at 5% of the body length the surface drag coefficients remained even lower than those of a turbulent flat plate of equal length, and with increasing Reynolds numbers they declined at a higher rate. Detailed studies on boundary layer development suggested that drag reduction resulted from the multiple curved (wavelike) outlines of the body. Due to alternating concave and convex parts, a stepwise pressure and velocity distribution was developed. Thereby, the thickness as well as the boundary layer in the turbulent velocity fluctuations within the boundary layer could be managed to keep the wall shear stress low. Hypothetically, by this mechanism, the vertical exchange of energy can be managed in a way that the boundary layer receives energy from the outer flow just sufficient to prevent flow separation.

COMPLIANT COATINGS FOR TRANSITIONAL BOUNDARY LAYER CONTROL

Yurchenko, N., Academy of Sciences of the Ukraine, Ukraine; High Speed Body Motion in Water; Feb. 1998; 8p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Visco-elastic properties of various materials and combinations of their layers were measured, results having been presented by stress-strain characteristics for samples defined by density, porosity, and layer thickness. To estimate the flow-surface interaction and to compare compliant coatings, they were characterized by nondimensional parameters describing their inertial, viscoelastic, and damping properties. Boundary-layer vortex dynamics was studied experimentally in a water channel over flat and concave, rigid and compliant surfaces at natural transition to turbulence and under the generation of longitudinal vortices. Compared to the rigid plate case, boundary layers over compliant surfaces were found to have a larger scale vortical structure. Besides, boundary layers over compliant surfaces demonstrated lower receptivity to external disturbances.

DYNAMICS OF VORTICES IN NEAR-WALL FLOWS: EIGENFREQUENCIES, RESONANT PROPERTIES, ALGORITHMS OF CONTROL

Gorban, V., Academy of Sciences of the Ukraine, Ukraine; Gorban, I., Academy of Sciences of the Ukraine, Ukraine; High Speed Body Motion in Water; Feb. 1998; 11p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Some ways of control of near-wall flow characteristics are analysed. They are based on generation in the flow of large vortical structures with special dynamic properties. In this connection, dynamics of 2-D stationary vortices located near the flow boundary irregularities are investigated by numerical simulation using the model of ideal incompressible fluid. Parameters of standing vortices in a cavity, behind a bulge, over a wavy wall, in the wake of a cylinder were calculated and the classification of stationary points for corresponding areas was made. The vortex located in the stationary point that was shown has the characteristic eigenfrequency. It leads to resonant interaction of the vortex with external perturbations, when the vortex frequency is similar to that of the perturbation. to generate the stationary vortices near a body, it is proposed to use special cavities (vortex chambers). Patterns of the flow near the wall with the cavity were obtained by the discrete vortex method. The steady standing vortex above a flat plate can be achieved in the active control system of pulsed sources with feedback.

The problem of a wing-shaped body moving close to the air-water interface is addressed in terms of an inviscid-rotational model in which the aerodynamic problem is coupled to the water flow by means of suitable interface conditions. A numerical procedure to solve the nonlinear unsteady problem is described. Numerical examples are given for some linearized cases. In particular the steady flow generated by a flat plate at incidence in forward motion over calm water is studied at first. The linearized wave-wing interaction is then analyzed in the frequency domain.

ABOUT MOVEMENT OF A WING ABOVE WAVY SURFACE OF WATER

Belynsky, V. G., Academy of Sciences of the Ukraine, Ukraine; Feb. 1998; 9p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

In the work, the outcome of an experimental research study on hydrodynamical characteristics of a wing driven above a wavy screen are represented. The description of experimental installation and techniques of realization of the experiment is given. The instantaneous significance of a lift coefficient for wings of the rectangular form in the plan, various elongations driven with various angles of attack on various distances from a flat screen and a screen, consisting of waves of sinusoidal structure of various length and height, are determined. The dependence of a lift coefficient of a wing form Strouhal number for movement above a wave screen is established. It is shown, that there is additional, not known earlier, gain of lift of a wing stipulated by the wavy form of the surface of water. The efficiency of a flap near to the screen is also discussed.

CAVITY SHAPES IN THREE DIMENSIONS

Tulin, M. P., California Univ., USA; High Speed Body Motion in Water; Feb. 1998; 8p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Cavitating and ventilated bodies produce trailing cavities of a length and volume out of all proportion to the dimensions of the body itself. The shape and dimensions of these cavities have attracted research interest which is intensified by the engineering of high speed bodies enveloped by their cavities in order to reduce their resistance. In his introductory work on the linearized, or thin body, theory of planar

supercavitating flows, the present author obtained asymptotic results defining the cavity shape, Tulin (1953). It was shown that the trailing planar cavity behind a head form was asymptotic in shape to a slender elliptic cylinder whose length, l , and thickness, T , depend in a simple way on the body drag coefficient, $C_{(sub D)}$, and cavitation number, $(\sigma) < 1$: l/t is approx. $= (8/\pi)C_{(sub D)}/\sigma(\exp 2)$ and T/t is approx. $= (4/\pi)C_{(sub D)}/\sigma$ where, t is a characteristic length of the body. Later, Tulin (1956), it was shown that in the case of a lifting foil, only the symmetric part of the flow field (i.e. strut-like) entered into the determination of the drag and cavity length. A few years later, Garabedian (1956) obtained corresponding results for axisymmetric bodies like cones: $(2): (l/d)(\exp 2)$ is approx. $= C_{(sub D)}/\sigma(\exp 2) \times$ natural log of $1/\sigma$. $(T/d)(\exp 2)$ is approx. $= C_{(sub D)}/\sigma$ where d is the diameter of the base of the cone forebody and $C_{(sub D)}$ is nondimensionalized with the base area. The shape of the trailing cavity is essentially spheroidal. Here we derive a generalization of (1) and (2) to the case of genuinely three dimensional headforms. It is clear that all possible head shapes are unlikely to shed cavities of the same general characteristics. For example, delta wings produce cavities with the appearance of a re-entrant jet along the top axis of symmetry, Tulin (1955), while rectangular wings produce smooth trailing cavities with the addition of strong cavitating tip vortices. As a prototype head-form we consider a wing of elliptical shape, span W and midchord C . The aspect ratio, AR , of the wing is W/C . This headform seems likely to produce a trailing cavity of basically ellipsoidal shape.

In the beginning I discuss basic results obtained in the theory of supercavities in compressible fluid, then I present the features of supersonic flow. Since 1980 in the USSR interest has arisen to supercavities in compressible fluid. On the basis of the slender body theoretical studies have been made. On the basis of the early numerical method Al'ev has calculated cavity past a thin cone. The recent development of numerical methods and the widespread use of computers has made it possible to calculate compressible cavitation flows efficiently.

Main concepts, results and methods of the linearized theory of axisymmetric supercavitation are presented on the basis of the slender body approximation in incompressible fluid. Because of the considerable increase of possible velocities of motion in water up to values comparable with the sonic velocity, an effort is made to apply the approach developed here to the analysis of supercavitation flows taking into account basic effects of compressibility.

WATER ENTRY OF SHIP SECTIONS AND AXISYMMETRIC BODIES

Faltinsen, Odd, Norwegian Univ. of Science and Technology, Norway; Zhao, Rong, Norwegian Marine Technology Research Inst., Norway; Feb. 1998; 11p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Theoretical methods for water entry of two-dimensional and axisymmetric bodies are presented. When the local angle between the water surface and the body surface is very small, hydroelasticity must be considered. The presented slamming analysis assumes the structure is rigid. Two 2-D numerical methods are discussed. One of the methods simplifies the dynamic free surface condition and details of the jet flow. Flow separation from sharp corners are incorporated. The simplified method is generalized to 3-D axisymmetric flow without flow separation. In order to verify the 3-D method, water entry of axisymmetric bodies with small local deadrise angles are studied analytically by means of matched asymptotic expansions. A composite solution for the pressure is presented. The numerical method is verified by comparing with the asymptotic method and validated by comparing with experiments for cones and spheres. It is demonstrated that satisfaction of exact body boundary condition is more important than satisfaction of exact free surface conditions. The effect of local rise up of the water is significant.

ASYMPTOTIC THEORIES OF INCOMPRESSIBLE WATER ENTRY

Fontaine, E., Ecole Centrale de Nantes, France; Cointe, R., Ministere de l'Environnement, France; Feb. 1998; 8p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The problem of a two-dimensional body impacting a free surface is studied using potential theory. When the angle (or its tangent) between the body and the free surface is very small, i.e. when the free surface and the body are almost parallel, the method of matched asymptotic expansions provides a first order composite solution. This solution includes three subdomains: the far-field, the spray root and the jet domains. This asymptotic solution appears to be a good approximation of the nonlinear solution, even for large values of the small parameter. In this paper, the asymptotic expansion for a wedge with small deadrise angle is extended up to second order for the far-field problem. This allows the jet volume to be taken into account within the composite solution. Then, a direct time domain simulation of the

problem is performed using a mixed Eulerian-Lagrangian method. In order to overcome the numerical difficulties that arise at the body-free surface intersection, a special numerical treatment is introduced, based on the asymptotic solution describing the jet. This treatment allows the influence of the jet to be accounted for without having to actually compute the flow in the jet.

STABILITY OF SUPERCAVITATING SLENDER BODY DURING WATER ENTRY AND UNDERWATER MOTION

Putlin, S. I., Academy of Sciences of the Ukraine, Ukraine; High Speed Body Motion in Water; Feb. 1998; 14p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

This paper describes the main results of experimental and theoretical investigations of slender body motion stability when it enters water and moves underwater in supercavitation conditions. Experimental investigations were used to study flows occurring in the situation considered and provide data for developing mathematical models of flows. Previously known theoretical relations for forces, acting on the body are defined more exactly and new ones are derived. A mathematical model of body motion in the supercavitating regime is provided.

The paper presents a numerical method for unsteady cavitation simulation around engines moving with large vertical velocity. The numerical modelling of the creation and the development of the cavitating flow zones attached to the profile, as well as the free surface deformation, is done using an interface tracking method of, Volume of Fluid, type, inserted into a Navier-Stokes code. Results show that the model is well adapted to simulate this complex physical phenomena.

REDUCTION OF OVERLOAD ON A BODY ENTERING WATER AT HIGH SPEED

Savchenko, V. T., Academy of Sciences of the Ukraine, Ukraine; High Speed Body Motion in Water; Feb. 1998; 6p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

An object at high speed entering water experiences significant overloads caused by sharp increases in density of the environment. In the present paper we consider two angles - the entrance angle (Theta) between a trajectory of body gravity center and a free surface; the attack angle (alpha) between the body's axis and direction of motion. So a whole hydrodynamic force F can be presented as a drag (axial) force X and a significant lift (lateral) force Y. Surrounding an object by a supercavity allows us to solve the series of problems, including the following: reducing hydrodynamic drag; reducing or eliminate destructive lift(lateral) loads for the object's appendage elements (ledges); damping(restrain) impact loads concentrated primarily on a cavitator. The presented research offers information based upon the results of the experiment's technical design for the new series of two-medium foils. Such foils provide the protection of stabilizers and rudders of two-medium apparatuses from destructive hydrodynamic forces.

CAVITATION SCALE EFFECTS: A REPRESENTATION OF ITS VISUAL APPEARANCE AND EMPIRICALLY FOUND RELATIONS
 Keller, Andreas P., Technische Univ., Germany; High Speed Body Motion in Water; Feb. 1998; 10p; In English; See also 19980020532; Original contains color illustrations; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Incipient cavitation was measured on four rotational symmetric test body families and a NACA 16020 profile at four different angles of attack, varying the size of the test bodies, the free stream velocity, the viscosity, and the free stream turbulence level. By these experiments, it was determined that all four parameters have strong effect on the cavitation inception of submerged bodies. The dependencies of the cavitation number on these parameters are called scale effects. As a prerequisite, the normally covering effect of the water quality, concerning its cavitation susceptibility, had to be got under control. This was achieved by measuring the tensile strength of the test water by means of vortex nozzle instrument. The relations deduced from the experimental results lead to empirical scaling relations of stunning simplicity.

TIP VORTEX ROLL-UP AND CAVITATION IN WATER AND POLYMER SOLUTIONS

Fruman, Daniel H., Ecole Nationale Supérieure de Techniques Avancées, France; Billard, Jean-Yves, Laboratoire d'Hydrodynamique Navale, France; High Speed Body Motion in Water; Feb. 1998; 10p; In English; See also 19980020532; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Results of experiments performed by ejecting semi-dilute drag reducing polymer solutions from an orifice situated at the tip of an elliptical hydrofoil are reported. It is demonstrated that the conditions for tip vortex cavitation occurrence are substantially modified by the ejection of very small flow rates of the polymer solutions while non appreciable alteration occurred when pure water is ejected. In order to investigate the causes of the cavitation inhibition effect, axial and tangential velocity profiles along the tip vortex in the very near region, comprised between the tip and one maximum chord downstream, were measured using Laser Doppler Anemometry. Statistical information on the moments and cross moments of the velocity fluctuations were also obtained. The ejection of the polymer solution results in the widening of the viscous core of the tip vortex, where the tangential velocities are reduced as compared to the pure water situation and the axial velocities display a marked wake effect. Changes are also apparent on the root mean square and skewness of the velocity fluctuations and on the cross moment of the axial and tangential velocity fluctuations. Analysis of the data indicates that the velocity modifications may be associated to the swelling of the polymer solution when issuing from the orifice. The changes of the velocity fluctuation and cross moments shows that they are essentially caused by the spatial bias introduced by the finite dimension of the measuring volume and the wandering of the vortex; "true" turbulence being a relatively small additional effect. By simulating the spatial bias effect it is shown that the ejection of the polymer solution results in a nearly complete suppression of the "true" turbulence in the core region.

Characteristic features are presented for high frequency, high-amplitude self-oscillations in a hydraulic system with a local hydraulic resistance of a venturi nozzle type whose physical nature is due to a periodically - stalled cavitation (growth, break-off, carry-over and

collapse of a cavity diffuser-like part). Analytical expressions are given to determine the frequencies and amplitudes of pressure oscillations occurring in the hydraulic system with a local hydraulic resistance under realization of the periodically - stalled cavitation regime. The possibility to utilize cavitation self-oscillations for various technological processes intensification is shown.

Some methods of control of fully developed cavity parameters by varying geometrical characteristics of a cavitating body are considered. Results of experimental investigations of cavitators with variable frontal drag and constant edge of free streamline separation and also some types of nonsymmetrical cavitators are presented. The possibility and a number of features of the fully developed cavity control independently on the cavitation number and cavitation regime (vapor or gas) are shown.

The results of the AGARD FDP Working Group 21 on "A Selection of Test Cases for the Validation of Large Eddy Simulations of Turbulent Flows" are presented in this report. The data contained in the report consist of building-block experiments documented in as much detail as possible. They are useful for the validation of Reynolds Averaged modeling and for the preliminary evaluation of experiments or turbulence theories. They include both laboratory experiments and direct numerical simulations. The introductory chapters are complemented by data sheets which describe in detail each data set, the experimental or numerical procedures, the expected errors, and the initial and boundary conditions. The data are given in machine-readable form in the CD-ROM that accompanies the report.

Computer codes which solve the Reynolds-averaged Navier-Stokes equations are now used by manufacturers to design turbomachines, but there is no consensus about which grids and which turbulence models are good enough to provide a reliable basis for design decisions. The AGARD Propulsion and Energetics Panel set up Working Group 26 to help to clarify these issues, by analysing predictions (using as wide a range of codes as possible) of two representative but difficult single blade row test cases: NASA Rotor 37 and an annular turbine cascade tested by DLR. This report presents the

Group's results and conclusions. Recommendations are made about the type and density of grid, which depend on many factors. Mixing-length turbulence models are unsuitable for turbomachines with their complex endwall flows; some kind of turbulent transport model is essential. No turbulence model was found which always gave good loss predictions.

There are many methods for measuring the velocity, pressure and temperature characteristics of the flows around solid bodies and this paper considers their relative advantages with special consideration of the needs of wind tunnels. The emphasis is on optical techniques for which brief descriptions of the principles and requirements are provided together with an indication of applications and their findings.

APPLICATION OF PIV IN THE LARGE LOW SPEED FACILITY OF DNW

Kooi, J. W., German-Dutch Wind Tunnel, Netherlands; Pengel, K., German-Dutch Wind Tunnel, Netherlands; Raffel, M., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Willert, C., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Kompenhans, J., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; May 1998; 12p; In English; See also 19980203985; Original contains color illustrations; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Particle Image Velocimetry (PIV) is a non-intrusive measurement technique capable of measuring the instantaneous velocity field in a two-dimensional plane. This technique has matured to a state that it now can be employed on a routine basis in large industrial wind tunnels. For that reason, the German Dutch Wind Tunnel has acquired a two-component PIV system for its Large Low Speed Facility. The main components of the system are a high speed video camera, a powerful pulsed Nd:YAG laser and for evaluation of the recordings a software system. The tracer particles are introduced in the flow by means of a rake mounted in the wind-tunnel settling chamber. A first application of the PIV system was the measurement of the trailing wake of transport type aircraft model. The measurement plane was positioned perpendicular to the main flow direction and the video camera was mounted on a traversing system installed inside the test section far downstream of the model. One of the important results was that in the individual velocity plots an unsteady vortex was found almost absent in the time averaged results. The PIV system cannot only be used in the closed wall test section of the DNW-LLF, but also in the Open Jet test section. Because of the large size of the facility the set-up requires both for the video camera and the pulse laser a stable support. This could be realised by using existing support systems.

ANALYSIS OF COMPLEX FLOW FIELDS BY ANIMATION OF PIV AND HIGH RESOLUTION UNSTEADY PRESSURE DATA

Coton, F., Glasgow Univ., UK; Galbraith, R., Glasgow Univ., UK; Grant, I., Heriot-Watt Univ., UK; Hurst, D., Glasgow Univ., UK; May 1998; 10p; In English; See also 19980203985; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

This paper describes the use of animation in the analysis of data from unsteady aerodynamic tests where the phenomena of interest vary both temporally and spatially. Particular emphasis is given to results from an investigation of blade vortex interaction (BVI) where both flow field and surface pressure data were recorded. It is shown that animation can be used, in a manner akin to basic flow visualisation, to identify the interesting features of such a flow and to, thus, guide more detailed conventional analysis techniques. The method adopted in this study involved the acquisition of a series of PIV images which were then processed and subsequently interpolated onto a regular grid. The temporal variation in velocity at each grid point was then established by a further interpolation between PIV frames. Finally, particles were placed in the initial velocity field and their subsequent trajectory during the interaction process calculated using a multi-step integration method.

Doppler Global Velocimetry is a non-intrusive wind tunnel diagnostic technique which has the potential to make simultaneous three-component velocity measurements over entire planes in the flow field. Measurements of velocity are based on determining the Doppler shift of single frequency laser light scattered off particles in the flow field. This technique has been used in the Subsonic Aerodynamic Research Laboratory wind tunnel at Wright Laboratory to make qualitative measurements of the flow associated with a vortex-tail interaction. This flow field is typical of the flows seen on twin-tail fighter aircraft. This paper presents results obtained with the DGV instrument and reports the current progress and recommendations towards developing an improved diagnostic system.

PLANAR DOPPLER VELOCIMETRY FOR LARGE-SCALE WIND TUNNEL APPLICATIONS

McKenzie, Robert L., NASA Ames Research Center, USA; May 1998; 14p; In English; See also 19980203985; Original contains color illustrations; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Planar Doppler Velocimetry (PDV) concepts using a pulsed laser are described and the obtainable minimum resolved velocities in large-scale wind tunnels are evaluated. Velocity-field measurements are shown to be possible at ranges of tens of meters and with single pulse resolutions as low as 2 m/s. Velocity measurements in the flow of a low-speed, turbulent jet are reported that demonstrate the ability of

PDV to acquire both average velocity fields and their fluctuation amplitudes, using procedures that are compatible with large-scale facility operations. The advantages of PDV over current Laser Doppler Anemometry and Particle Image Velocimetry techniques appear to be significant for applications to large facilities.

The global doppler velocity meter is a non-intrusive method based on measurement of the doppler shift of a light diffused by a flow made of particles illuminated by a flat laser beam at frequency ν_0 . Observed through an iodine cartridge any doppler shift is translated immediately into a variation of light absorption. This technique allows one to obtain the velocity field of the embedded flow of particles at an acquisition rate which depends only on the recording equipment. The studies which have been carried out to date make use of a single-mode ionized argon laser in which the green emission line is fortuitously tuned to two unresolved absorption lines of the iodine whose strength depends greatly on temperature. In order to avoid this obstacle a continuous dye laser tunable by frequency was used, which gives one an extremely easy choice of an absorption line of a molecule in which the population is almost not dependent on temperature and the profile is more or less steep as a function of the velocity range to be measured. The first tests were conducted on a rotating disk, the speeds determined by a global doppler velocity meter are in good agreement with that measured by a tachometer, and then measurements were conducted in a wind tunnel. A summary is given of the improvements made to increase the precision.

The paper reviews the various optical techniques which can be applied for point, line of sight or imaging measurements. In the category of point measurements, light scattering methods like Raman, Rayleigh or Electron Beam Fluorescence (EBF) are treated first, but briefly since they are of little use, especially when enthalpy is very high and flow naturally bright. The emphasis is placed instead on nonlinear laser spectroscopy like Coherent anti-Stokes Raman Scattering (CARS), which has recently achieved great success at getting temperatures and density in high enthalpy shocks. Then, the diode laser absorption spectroscopy is described. A high data rate instrument now gives, on a routine basis, the static temperature and the velocity of the stream in the hot shot facility F4 of ONERA, at stagnation enthalpies in excess of 15 MJ/kg. EBF imaging in that same facility has permitted measurements of velocity to be performed across the external boundary layer into the flow core thanks to a high energy pulsed electron gun. Finally, the technique of Collective Light Scattering is briefly described and its capabilities demonstrated.

ROTATIONAL AND VIBRATIONAL TEMPERATURES AND DENSITY MEASUREMENTS BY COHERENT ANTI-STOKES RAMAN SCATTERING IN A NONEQUILIBRIUM SHOCK LAYER FLOW

Grisch, F., Office National d'Etudes et de Recherches Aeronautiques,

France; Bouchardy, P., Office National d'Etudes et de Recherches Aeronautiques, France; Koch, U., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Guelhan, A., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; May 1998; 10p; In English; See also 19980203985; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Coherent anti-Stokes Raman scattering studies are carried out in a nonequilibrium shock layer air flow induced by a two-dimensional body. Rovibrational spectra of molecular nitrogen are recorded by scanning CARS in the free stream and within the shock layer at moderately high enthalpy (7.3 MJ/kg). Difficulties peculiar to the application of the optical technique to a high enthalpy flow are discussed and flow parameters are given. The rotational temperature, vibrational temperature and number density are measured and compared to theoretical values predicted by a Navier-Stokes solver. A good agreement is found.

A digital holographic interferometry technique is presented which provides non-intrusive, quantitative measurements of the density distribution in a compressible flow field. Using a pulsed laser, flow fields may be essentially frozen, so that a measurement is obtained for a whole field at a single instant. Thus, unsteady, turbulent flow fields may also be studied. The technique provides a measurement of the density projected along the light path, so that the local density may be determined for two-dimensional and axisymmetric flows. Even for relatively complicated flow fields, quantitative projection data may thus be obtained. By sending several probe beams through a flow field simultaneously at different angles, the instantaneous three-dimensional density distribution in unsteady fields may also be obtained using tomographic reconstruction techniques. To furthermore gain insight into the temporal behaviour of turbulent flows, quantitative differential recordings can also be made. Thus, the technique presented here may be used to examine the (instantaneous) three-dimensional structure of a density field as well as its fluctuations in time. To illustrate the technique, results are presented here for the supersonic flow around a re-entry body, for an under-expanded free jet flow and for an oscillating flow issued by a so-called pipe-collar nozzle.

WALL-SHEAR STRESS MEASUREMENT WITH QUANTITATIVE IR-THERMOGRAPHY

Mayer, R., Technische Univ., Netherlands; Henkes, R. A. W. M., Technische Univ., Netherlands; van Ingen, J. L., Technische Univ., Nether-

lands; May 1998; 12p; In English; See also 19980203985; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

This paper presents a new non-intrusive and flexible measurement technique for wall-shear stresses, which is based on the theory of hot-films. To overcome the disadvantage of being limited to a single measurement position like the hot-film, the internal electrical heating and internal temperature detection is replaced by external heating using a laser and external temperature measurement using quantitative infrared thermography, respectively. In this technique the laser is generating a hot spot on the surface of an object. By choosing suitable materials for the solid object with a low thermal conductivity and a high emissivity of thermal radiation a geometrically small but clearly detectable temperature spot can be generated. After the temperature distribution in the solid has become steady, the laser is turned off and the temperature decay of the hot spot is monitored by the camera. From the measured surface-temperature distribution history, the heat transfer to the fluid and the wall-shear stress can be derived by using a numerical procedure. This technique is demonstrated for a Blasius boundary layer in a wind-tunnel experiment, where an accuracy of about 10% has been achieved in the determination of the wall-shear stress.

SKIN FRICTION MEASUREMENT AND TRANSITION DETECTION TECHNIQUES FOR THE LUDWIG-TUBES AT DLR

Schuelein, E., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Koch, S., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Rosemann, H., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; May 1998; 10p; In English; See also 19980203985; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Three different skin friction measurement and transition detection techniques have been developed and adapted to the specific test conditions in the Ludwig-Tube facilities of DLR at Goettingen. The latter are: short run time and thin boundary layers for both, the hypersonic Ludwig-Tube facility (RWG) and the Cryogenic Ludwig-Tube (KRG), and low temperatures for the KRG, which can be operated down to 120 K to achieve high Reynolds numbers. An oil film technique has been developed and applied to measure skin friction and transition on a flat plate in the RWG at $M = 5$. The results are in good agreement with the Van Driest II and the Young correlation, respectively, and results from velocity profile measurements for the skin friction and hot-wire measurements for the transition location. Surface mounted hot-films, directly deposited on the model surface, have been used to study shock oscillations on a laminar type airfoil in the KRG down to cryogenic conditions. Further improvements of the deposition quality will make sensor arrays with about 20 sensors on an airfoil section with 150 mm chord available. It could be demonstrated that wall mounted thermocouples provide a simple method to determine transition on airfoils in the KRG by detecting the difference in heat flux between laminar and turbulent boundary layers. The results agree well with the interpretation of pressure distribution and wake measurements as well as with the transition location given by the MSES (Drela) code.

Steady and unsteady surface measurement techniques for subsonic and transonic flows are surveyed emphasizing the capabilities, restrictions and applications of these techniques in experimental aerodynamics. The present paper investigates comparatively the status and capabilities of a number of surface measurement tech-

niques (Liquid Crystals, HotFilm-Arrays, Piezofoil-Arrays,) which are necessary for the understanding of distributed flow phenomena. Based on exemplary results, some of the main features of the measurement techniques are discussed. Emphasis is on recent improvements to obtain higher temporal and spatial resolution. This concerns e.g. the employment of pyroelectrical capabilities for higher signal-to-noise ratios in piezofoil array measurements, or the development of a standard calibration method for multisensor hot-film arrays with small streamwise sensor spacing.

APPLICATION OF OIL FILM INTERFEROMETRY SKIN-FRICTION TO LARGE WIND TUNNELS

Driver, David M., NASA Ames Research Center, USA; May 1998; 10p; In English; See also 19980203985; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The oil film interferometry skin-friction technique is described and applied to flows in some of the NASA Ames large wind tunnel facilities. Various schemes for applying the technique are discussed. Results are shown for tests in several wind tunnels which illustrate the oil film's ability to measure a variety of flow features such as shock waves separation, and 3D flow.

VISUALIZATION AND MEASUREMENT OF SURFACE SHEAR STRESS VECTOR DISTRIBUTIONS USING LIQUID CRYSTAL COATINGS

Reda, Daniel C., NASA Ames Research Center, USA; Wilder, Michael C., MCAT Inst., USA; May 1998; 10p; In English; See also 19980203985; Original contains color illustrations

When a shear-sensitive liquid crystal coating is illuminated from the normal direction by white light and observed from an oblique above-plane view angle, its color-change response to shear depends on both shear stress vector magnitude and the direction of the applied shear vector relative to the observer's in-plane line of sight. At any point, the maximum color change is always seen or measured when the local shear vector is aligned with, and directed away from, the observer; the magnitude of the color change at this vector/observer aligned orientation scales directly with shear stress magnitude. Conversely, any point exposed to a shear vector with a component directed toward the observer exhibits a noncolor-change response, always characterized by a rusty red or brown color, independent of both shear magnitude and direction. Based on this knowledge, full-surface shear stress vector visualization and measurement methodologies were formulated and successfully demonstrated. The present paper reviews the observations and measurements that led to the development of these methodologies and applications of both are discussed.

SHEAR SENSITIVE LIQUID CRYSTALS IN SUBSONIC AND TRANSONIC WIND TUNNEL TESTING

Lombardi, G., Pisa Univ., Italy; Morelli, M., Council for Scientific and Industrial Research, South Africa; May 1998; 10p; In English; See also 19980203985; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The present paper singles out the advantages connected with the use of the liquid crystal technique for the visualization of the surface flow phenomena during wind tunnel test; they appear significant, and can be summarized in reversibility, non-toxicity and low cost. The more significant benefits are that different types of analysis (boundary layer transition, separation and reattachment, shock wave position) can be performed with a single technique, and that the reversibility of the

process gives the possibility to analyze several conditions in a single run of the wind tunnel. Therefore, the technique is characterized by low cost and time requirements. In any case, it is important to note that several effects can affect the images and this implies a degree of uncertainty in the interpretation of the results. It is therefore necessary to acquire a high confidence level in the technique in order to assure a good degree of repeatability and accuracy in the analysis of the results. Mainly, the use of the technique is related to the visualization of the main feature of the surface flow. In this regard, several examples showing the determination of the boundary layer transition, separation lines and the shock wave position on the surface, are presented. To enhance the knowledge on the boundary layer conditions a quantitative use of this technique will be a powerful tool. Several attempts to have a quantification of the response of the liquid crystals were carried out and are discussed in the paper. Nevertheless, it is necessary to stress that, at the present state of the research, the technique is probably not precise enough for an absolute determination of the local shear stress, and the indicated procedure seems applicable only for comparative tests.

LASER TWO-FOCUS FLOW FIELD INVESTIGATION WITHIN A HIGH-SPEED HIGH-PRESSURE CENTRIFUGAL COMPRESSOR
 Trebinjac, I., Centre National de la Recherche Scientifique, France; Claudin, I., Centre National de la Recherche Scientifique, France; Advanced Non-Intrusive Instrumentation for Propulsion Engines; May 1998; 8p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The results of measurements carried out in a transonic centrifugal compressor with splitter vanes are presented and discussed. The laser two-focus anemometry technique is described, including the seeding control which is a crucial issue in a high temperature level environment. Whereas a potential flow structure exists up to the high meridional curvature region, the through flow pattern is largely distorted in the radial part of the impeller. Noticeable differences in flow pattern between both channels are found, particularly through the low momentum fluid zone locations. A qualitative study of the vortical mechanisms ascribes them to the tin clearance effects.

3-D LDA MEASUREMENTS IN AN ANNULAR CASCADE FOR STUDYING TIP CLEARANCE EFFECTS

Doukelis, A., National Technical Univ., Greece; Mathiosdakis, K., National Technical Univ., Greece; Founti, M., National Technical Univ., Greece; Papailiou, K., National Technical Univ., Greece; May 1998; 12p; In English; See also 19980206002; Original contains color illustrations; Sponsored in part by CEU
 Contract(s)/Grant(s): AERO-CT2-0039; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Literature survey indicates the lack of detailed 3-D flowfield data for high-speed flows inside turbomachines, especially in the region of the tip clearance gap, and points out the difficulties in conducting this kind of measurements. Such information is nevertheless essential in order to validate CFD codes, which give the possibility of understanding the flow and finally producing better designs of efficient turbomachinery components. This paper aims at presenting a 3-D LDA measurement technique, as applied for the measurement of the flowfield in an annular cascade used to study tip clearance effects. First the measurement system layout, signal processing and data acquisition, and processing is presented in detail, together with an evaluation of the measuring accuracy and the measuring capabilities of the system in simple flows. Next the annular cascade configuration is described, together with a detailed account of all the aspects of execution of the

measurements and the provisions taken in this study. Finally sample measurements results, demonstrating the kind of information provided, are presented.

LASER TWO FOCUS ANEMOMETRY (L2F-3D) FOR THREE-DIMENSIONAL FLOW ANALYSIS IN AN AXIAL COMPRESSOR
 Vouillarmet, A., Centre National de la Recherche Scientifique, France; Charpenel, S., Centre National de la Recherche Scientifique, France; May 1998; 12p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

In order to improve the accuracy of numerical simulations applied to the new generation of high loaded, high-speed turbomachines, a thorough understanding of the 3D phenomena is needed. For that purpose, the use of 3D experimental techniques, like 3D-L2F anemometry, is now absolutely necessary. This paper deals with a statistical method for processing the data. The point is that, during the acquisition procedure, marginal and conditional probability density functions (p.d.f.) are obtained, but they are already integrated quantities. Hence, it becomes impossible to derive analytical relations between the p.d.f. and the 3D first and second order momenta. However, an issue can be found using an isotropic turbulence hypothesis. This method has been, first of all, tested in an axisymmetrical free jet. Furthermore, an experimental investigation of the three dimensional flow field within the tip area of a high loaded, low-speed axial compressor was performed.

LASER-2-FOCUS MEASUREMENTS ON A TURBINE CASCADE WITH LEADING EDGE FILM COOLING

Ardey, S., Universitaet der Bundeswehr Muenchen, Germany; Fottnar, L., Universitaet der Bundeswehr Muenchen, Germany; Beversdorf, M., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Weyer, H., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; May 1998; 12p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

In order to increase the understanding of the aerodynamic processes dominating the flow field of turbine bladings with leading edge film cooling, isothermal investigations were carried out on a large scale high pressure turbine cascade. Close to the stagnation point the turbine cascade has one row of film cooling holes on the suction side and another one on the pressure side. Blowing ratio, turbulence intensity, Mach number, and Reynolds number are set to values typically found in modern gas turbines. Since a very sensitive flow pattern with high velocity gradients and reverse flow areas was to be expected near the blowing holes the Laser-2-Focus technique was selected for investigations in this area. Two independent systems were used: A standard two dimensional Laser-2-Focus system permanently installed in the wind tunnel and a temporarily set up three dimensional Laser-2-Focus system of the DLR-Institut fuer Antriebstechnik, Koln. The results of the two systems are in good agreement. They indicate vortices in the exit plane of the film cooling holes developing into a flow pattern with upwinds directly behind the holes and downwinds further downstream. In the wake of the pressure side holes a large recirculation zone can be observed located below the coolant jet.

PSP: INTENSITY AND LIFETIME MEASUREMENTS FOR STEADY AND NONSTEADY FLOW

Engler, R. H., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Klein, C., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; May 1998; 10p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

DLR started in 1995 with their own Pressure Sensitive-Paints (PSP) activities. A phase of extensive exploration of hard- and software-components followed and internal measurements using the intensity and lifetime method which includes spectra, calibration curves, etc. were performed. A repeatability study was made on the DASA HYTEX model, comparing the Inteco OPMS measurements from 1992/94 with the now existing DLR PSP system. Therefore, different lamps and laser illumination systems were tested. This included several cameras (intensified CCD and non-intensified CCD) for comparison of different paint samples in an external calibration chamber. After these pre-tests in the calibration chamber, measurements were performed in the Transonic Wind Tunnel Goettingen (TWG).

Pressure and temperature sensitive paints have been utilized for the measurement of blade surface pressure and temperature distributions in a high speed axial compressor and an Allied Signal F109 gas turbine engine. Alternate blades were painted with temperature sensitive paints and then pressure sensitive paint. This combination allows temperature distributions to be accounted for when determining the blade suction surface pressure distribution. Measurements were taken and pressure maps on the suction surface of a blade were obtained over a range of rotational speeds. Pressure maps of the suction surface show strong shock waves at the higher speeds.

The transient liquid crystal technique has been used to measure the heat transfer coefficient and cooling effectiveness over heavily film cooled nozzle guide vanes (NGVs). The measurements were

performed in the complex environment of a transonic annular cascade which simulates the flow in the gas turbine jet engine. Engine-representative Mach and Reynolds numbers were created and the aerodynamic and thermodynamic characteristics of the coolant flow (momentum flux and density ratio between the coolant and mainstream) have been modelled by using heavy foreign gases (SF₆/Ar mixture). The Red-Green-Blue (RGB) components have been separated from the colour response of wide-band encapsulated liquid crystals which react to changes of the NGV surface temperature during the transient experiment. Optical access to the test NGV was problematic and the thermochromic response of the crystals was sensitive to both the lighting and the wide range of viewing angles subtended at the camera. An in situ calibration is used to translate the RGB histories to measurements of the surface temperature history, and hence local heat transfer coefficient and adiabatic wall temperatures were obtained. The colour data has been gathered using a miniature CCD camera and recorded directly to computer memory without the use of video tape recorder. The transient liquid crystal technique is shown to be capable of accurately gathering data over any portion of the NGV surface visible to the camera used. As the data is collected in an environment which models the engine, the data is of benefit for both CFD code validation and directly to the engine designer.

MEASUREMENT OF UNSTEADY WAKE-BOUNDARY LAYER INTERACTION USING HOT FILMS

Gete, Zenebe, British Columbia Univ., Canada; Evans, R. L., British Columbia Univ., Canada; May 1998; 14p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Boundary layers developing on a surface subject to the intermittent passage of wakes, such as those on turbomachinery blading, are known to be highly unsteady. In this experimental study, a flat plate mounted in a wind tunnel downstream of a moving wake generator was used to model the wake-boundary layer interaction process in actual turbomachines. The boundary layer and the wall shear stress developing on the flat plate in this unsteady environment were measured using hot wire Anemometry and hot film sensors mounted on the plate surface. Measurements were taken at several locations downstream of the plate leading edge, and at several values of the reduced frequency. The results from the hot-film sensors showed that the unsteady boundary layer resulted in significantly higher losses in comparison to a steady boundary layer developing in the absence of passing wakes.

MEASUREMENTS WITH SURFACE MOUNTED HOT-FILM SENSORS ON BOUNDARY LAYER TRANSITION IN WAKE DISTURBED FLOW

Hauelsen, Volkmar, Technische Univ., Germany; Schroeder, Thomas, Technische Univ., Germany; Hennecke, Dietmar K., Technische Univ., Germany; May 1998; 14p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Boundary layer transition with and without transitional separation bubbles on a circular cylinder in crossflow was investigated. Measurements were carried out in undisturbed, steadily disturbed, and periodically disturbed flow. Besides the surface static pressure distribution and besides the measurement of velocity profiles with a hot-wire probe the investigations were focussed on the signal distributions of surface mounted hot-films. The reaction of separation and transition to changes of the Reynolds number or the degree of disturbance can be observed. In comparison with the hot-wire traverses, which were carried out in parallel with the hot-film measurements, the experiments show that the surface-mounted hot-film-technique is suitable to obtain reliable information on transition and separation phenomena with both high spatial and temporal resolution. Measurements with surface-

mounted hot-film sensors in a multistage aero-engine low-pressure turbine show that use of this technique is not only restricted to laboratory conditions but is as well suitable for complex geometry and engine condition.

TIME RESOLVED MEASUREMENTS OF TURBINE BLADE FLOW PHENOMENA

Diller, T. E., Virginia Polytechnic Inst. and State Univ., USA; Ng, W. F., Virginia Polytechnic Inst. and State Univ., USA; Schetz, J. A., Virginia Polytechnic Inst. and State Univ., USA; May 1998; 10p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The facility and instrumentation are described for studying the effects of time-dependent flow phenomena. The components of unsteadiness from upstream rotor blades and the combustor of a gas turbine engine are modeled individually as shocks, wakes, and free-stream turbulence. The decomposition of the unsteadiness allows fundamental physical modeling of the effects on the flow structure and blade heat transfer. The strength and spacing of the shocks, the intensity and length-scale of the turbulence, and the wake velocity defect and turbulence can all be independently controlled. The blow-down facility provides 30 seconds of heated flow through a stationary blade cascade that matches the Reynolds number, Mach number, and temperature ratio characteristics of advanced gas turbine engines. Detailed observations are provided by spark shadowgraphs (10(exp -8) sec.), laser interferometry (10(exp -7) sec.) to obtain the instantaneous global density field, and surface pressure and heat flux measurements. The heat flux measurements have a time response of less than 10 micro-sec with a continuous voltage output. Because the sensors are less than 2 micro-m thick, they are non-intrusive to the flow and temperature fields. As one example of the capabilities, computer visualization from shadowgraphs of shock propagation through a blade passage with simultaneous surface pressure and heat flux measurements will be shown.

In high pressure turbines the flow in the stator-rotor interaction region is highly complex with periodic and random unsteady effects generated as the stator wakes impinge on the rotor blades. Measuring the flow in this region is difficult with conventional instrumentation, further complicated in a short duration facility. This paper discusses the application of particle image velocimetry to this region of flow and, outlines the technological advances made recently to demonstrate the technique in the short duration Isentropic Light Piston Facility (ILPF) at DERA Pyestock. A series of measurements have been made in the stator passage and the stator-rotor gap region of the MTI high pressure turbine stage, in the ILPF. The measurements have been made at full engine-representative flow conditions and provide an instantaneous quantitative whole field visualisation of this unsteady flow region. The measured velocity field is compared with computational fluid dynamics

(CFD) predictions obtained using a three-dimensional viscous flow solver. These measurements are thought to be the first to be made in a rotating transonic facility.

THE UNSTEADY STRUCTURE OF SIMULATED TURBINE FILM COOLING FLOWS FROM PIV

Rivir, Richard B., Wright Lab., USA; Gogineni, Sivaram, Innovative Scientific Solutions, Inc., USA; Goss, Larry P., Innovative Scientific Solutions, Inc., USA; Pestian, David J., Dayton Univ. Research Inst., USA; May 1998; 14p; In English; See also 19980206002; Contract(s)/Grant(s): AF Proj. 2307; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Unsteady turbine film cooling flows are subjected to free stream disturbances which exceed those of a fully turbulent boundary layer. Hot wires, cold wires, and thermocouples have in the past been used to obtain local, time resolved point measurements of velocity, temperature, and mixing. The structure of the flow and its interaction with free stream structures remains largely hidden. Two-color, double pulsed, PIV (Particle Image Velocimetry) was used to investigate simulated turbine film-cooling flows with high free stream turbulence and wake passing. High resolution (3000 x 2000 pixels), instantaneous, velocity distributions obtained by CCD camera have been compared against those obtained from 35mm film digitized at 2700 ppi resulted in realizations with similar spatial resolution. Averages of 1 to 30 instantaneous PIV velocity measurements have been compared against simulated turbine film cooling flow velocity profiles measured by hot wire. The resulting PIV velocity profile measurements were mostly within the envelope of the mean and rms velocity measurements of the hot wire. The PIV images allow instantaneous estimates of the shear layer development, vertical cooling jet film spread, turning, and interactions with the free stream turbulence. Instantaneous vorticity, and dissipation distributions have also been obtained. The lateral jet spread of the film at the wall was measured with liquid crystals and thermocouples and compared with the vertical PIV spread. The centerline vertical film jet spread, turning angle, and shear layer growth has been characterized from the PIV realizations as a function of blowing ratio, Reynolds number, periodic forcing amplitude, frequency, and free stream turbulence.

Recent success in the implementation of particle image velocimetry (PIV) as a useful two-dimensional technique has encouraged efforts to develop three-dimension nonintrusive methods Holography appears to be a suitable technique to image three-dimensional flows seeded with small particles. A novel technique to process double or multiple exposure holograms has been developed during the last four years. Information about velocity and particle size is obtained by using an optical/digital processing technique. The interference pattern due to light-waves emanating from particles images is imaged and then processed digitally. Applicability of the concept is first demonstrated by processing a double-exposed hologram of a synthetic particles field submitted to a known displacement. For different ratios between the depth (out-of-plane) displacement component and the lateral (in-plane) one, results are discussed. They show that the accuracy is strongly related to the choice of the digital processing parameters, especially the number of fringes which are contained in the interfer-

ence pattern. Additional benchmarking of the technique has been carried out by applying it to a real flow of which velocity and direction are well known. Therefore, a jet flow facility with adjustable yaw and pitch angle has been designed. Various flow configurations have been investigated. At present state of work, processing results have to be improved. The diffraction halo of the particle images is so small that a limited number of fringes are available at the output of the optical processing part. Thus results of the digital processing algorithm are affected by a large uncertainty.

APPLICATIONS OF THREE DIMENSIONAL DOPPLER GLOBAL VELOCIMETRY TO TURBO MACHINERY AND WIND TUNNEL FLOWS

Roehle, I., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Schodl, R., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; May 1998; 14p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Doppler Global Velocimetry is an imaging anemometer. A DGV system optimised for time averaged three component velocity measurements was designed and set up. The first application of the system was the investigation of the flow field of a swirl spray nozzle in a cylindrical casing. The flow field in the whole volume of the combustor was measured. The DGV System was also applied to investigate the wake region of a car model in a wind tunnel. An arrangement with three light sheets was chosen. The 3D-DGV results are in a good agreement with 3D-LDA measurements of the same flow. 3D-DGV measurements were carried out inside the model of the inlet of a fighter aircraft. A flexible endoscope was used to overcome the serious problems of the optical excess of this fully capsuled flow.

This paper describes a new concept of over-the-horizon detection adjusted to surveillance of low altitude targets. The radar unit, in bistatic configuration, consists of a receiving system installed in the vicinity of the area to be monitored, and of a distant emitter, located behind the zone to be monitored. Overall functioning of the radar unit relies on combination of an 'ionospheric' propagation mode and a 'surface wave' propagation mode. Thus, because of the properties of reflection of electromagnetic waves in the ionosphere, the low altitude targets can be illuminated by the distant emitter, which will function at high frequencies. The electromagnetic waves, following interaction with the targets, will propagate by following the curvature of the earth (by 'surface waves') up to the receiving network. This concept comprises an alternative to the over-the-horizon radar by traditional surface waves (OTH-S), by placing in the geographic area to be monitored, the advantage of a passive and discrete device, which is provided with important integration capabilities.

The results of the phase 2 effort conducted under AGARD Working Group 18 on Hypersonic Experimental and Computational Capability, Improvement and Validation are presented in this report. The first volume, published in May 1996, mainly focused on the design methodology, plans and some initial results of experiments that had been conducted to serve as validation benchmarks. The current volume presents the detailed experimental and computational data base developed during this effort.

The report assesses the capability for numerical simulation of 2-D and 3-D shock wave laminar and turbulent boundary layer interactions. Three fundamental configurations are considered: single fin, double fin, and hollow cylinder flare. Thirteen separate cases were examined by a distinguished international group of researchers using the Reynolds-averaged Navier-Stokes (RANS) equations with a wide range of turbulence models from zero equation to full Reynolds Stress Equation formulations. The report presents an extensive comparison of computations and experimental data, summarizes the results, and makes recommendations for future research.

HYPERSONIC LAMINAR-TURBULENT TRANSITION

Saric, William S., Arizona State Univ., USA; Reshotko, Eli, Case Western Reserve Univ., USA; Arnal, Daniel, Centre d'Etudes et de Recherches, France; Hypersonic Experimental and Computational Capability, Improvement and Validation; December 1998; Volume 2; 27p; In English; See also 19990024917; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

The computational and experimental progress covering the four basic instability mechanisms that contribute to laminar-turbulent transition is reviewed. Streamwise, crossflow, centrifugal, and attachment-line instabilities and their principal means for initiating transition in hypersonic boundary layers are discussed. Comparisons between computations and experiments are given. Issues relating to how free-stream disturbances influence the initial amplitudes of disturbances are also documented. Particular attention is paid to prediction schemes based on linear theory although other techniques are

reviewed. This discussion is used to review the capabilities of present and future transition prediction methods as well as flow-quality requirements for hypersonic experimental facilities.

RAREFIED FLOW

Moss, James N., NASA Langley Research Center, USA; Lengrand, Jean-Claude, Centre National de la Recherche Scientifique, France; Hypersonic Experimental and Computational Capability, Improvement and Validation; December 1998; Volume 2; 28p; In English; See also 19990024917; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

Rarefaction effects are important for hypersonic applications for a wide spectrum of conditions ranging from low-density (high altitude) situations to relatively high-density flows where the characteristic dimension is small. The present chapter concentrates on two hypersonic flow problems at flow conditions that produce a significant range of rarefaction effects: corner flow with jet interaction and blunt body flow with special emphasis on the near wake. These problems were chosen because they involve complex flow interactions that have significant implications for both spacecraft and re-entry vehicles. In an effort to clarify issues associated with these two general flow problems and to enhance their respective databases, both experimental and computational contributions were executed by an international group of researchers. In some cases, multiple data sources for both experimental and computational contributions are achieved.

REAL GAS/BLUNT CONE, PHASE 2

Deiwert, George S., NASA Ames Research Center, USA; Eitelberg, Georg, Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Hypersonic Experimental and Computational Capability, Improvement and Validation; December 1998; Volume 2; 21p; In English; See also 19990024917; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

In this chapter recent activity in real-gas database definition and code validation will be summarized. In the Phase I report of the Working Group (WG) 181, aerothermodynamic problems were classified, for purpose of discussion, into seven types: aerodynamic parameters, viscous/shock interaction, boundary-layer transition, forebody-heating/heat-transfer, radiation and ablation, lee and base-region flow, and low-density flow. Several of these problem types were the subject of various chapters of the Phase I report describing real-gas effects and ground test facility issues. In this chapter some background and objectives outlined in the real-gas effects Chapter V of the Phase I report will be reviewed. The results of the blunt cone test campaign developed under the auspices of the WG18 activity to study real-gas phenomena will be summarized, including the experimental and computational programs, issues and questions, and recommendations. Further, recent progress in other real-gas areas beyond the blunt cone test campaign will be discussed. Finally, a summary in which the present status of our understanding of real-gas issues will be presented.

INFRARED AND MILLIMETER WAVE DETECTION USING THIN FILMS OF PB DOPED BISRCACUO SUPERCONDUCTOR

Phong, L. Ngo, Defence Research Establishment Valcartier, Canada; AGARD, Guidance and Control for Future Air-Defence Systems; Jan 1, 1995, 10 p; In English; See also 19950025702; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Thin film detectors made of CuO superconductors were developed in our laboratory. This article reports details of the fabrication and testing of Pb doped BiSRCaCuO detectors. The detector comprises a film sensor housed in a small cryostat with built-in bias supply and temperature control circuitry. The film sensor was first deposited by magnetron rf sputtering and then crystallized under a rapid thermal annealing process. The characteristics of the response of the detector under millimeter wave and infrared illumination were investigated. The millimeter wave response exhibited a Josephson component with a D^* approximately $10(\exp 8) - 10(\exp 9)$ cm.Hz($\exp(1/2)$)/W in the wavelength range of 3 - 8 mm. The transient response to short pulses indicated a time constant τ less than or equal to 10 ns for this component. The response to laser pulses was thermal in origin and inherently compressible, preventing saturation of the detector electronics to intense beams. The wide band characteristic of the responses at both infrared and millimeter wavelengths could be confirmed. The damage threshold of the film sensor was shown to exceed 10 mJ / sq cm per 3 ns pulse. The possible use of these detectors for threat detection and the optimization of their figure of merit are discussed.

Software ROSACE (Optimization of Realistic Systems, Contributions to the Design and the Evaluation), is developed within the framework of the study methodology of multisensors for anti-aircraft defense and is financed by the DRET (contract n 91-34-846). This document concerns a interactive tool, that is evolutionary, portable and of assistance to the definition, the qualification, and the optimization of multisensor systems for anti-aircraft monitoring and defense. This product constitutes a support for the expertise and search for new treatments which utilize the fusion of information and are likely to improve the performance of the system. These algorithms primarily ensure (but not exclusively) the tasks of detection and continuation or classification of air machines and make it possible to analyze the reliability of the system confronted with different scenarios.

Parameters of gyro systems (accuracy, size, power consumption, reliability, etc.) are determined by parameters of the elements of

which the gyro unit consists. The elements developed for military equipment meet the utmost requirements. Over the past ten years the 'Delphin' Central Research Institute developed a whole number of elements including a gyro, an accelerometer, a torquer, a slip-ring assembly, etc. to provide a basis for designing gyro systems for military purposes. The conversion made it possible to use these elements in commercial gyro systems. The present paper deals with such elements and systems created on their basis and used for commercial purposes.

The results of military to commercial conversion in the field of laser gyro technology are considered. Laser gyro systems were developed in Russia for military purposes. After some modifications within an international cooperation they are used nowadays also for civil applications as track surveying, deformation measurements of long objects and precision angle and angular rate measurements and angle calibration.

DUAL-USE MICROMECHANICAL INERTIAL SENSORS

Elwell, John M., Jr., Draper (Charles Stark) Lab., Inc., USA; AGARD, Dual Usage in Military and Commercial Technology in Guidance and Control; Mar 1, 1995, 6 p; In English; See also 19950026705; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

A new industry, which will provide low-cost silicon-based inertial sensors to the commercial and military markets, is being created. Inertial measurement units are used extensively in military systems, and new versions are expected to find their way into commercial products, such as automobiles, as production costs fall as technology advances. An automotive inertial measurement unit can be expected to perform a complete range of control, diagnostic, and navigation functions. These functions are expected to provide significant active safety, performance, comfort, convenience, and fuel economy advantages to the automotive consumer. An inertial measurement unit applicable to the automobile industry would meet many of the performance requirements for the military in important areas, such as antenna and image stabilization, autopilot control, and the guidance of smart weapons. Such a new industrial base will significantly reduce the acquisition cost of many future tactical weapons systems. An alliance, consisting of the Charles Stark Draper Laboratory and Rockwell International, has been created to develop inertial products for this new industry.

LASER GYROSCOPY TENDENCIES AND THEIR ANALYSIS OF DEVELOPMENT IN UKRAINE

Dovbeshko, Alexander A., Scientific Research Inst. of Mechanical Problems, Ukraine; AGARD, Dual Usage in Military and Commercial Technology in Guidance and Control; Mar 1, 1995, 11 p; In English;

See also 19950026705; Copyright; Avail: CASI; A03, Hardcopy; A02, Microfiche

These papers deal with the theoretical and experimental data analysis approach of the accuracy and characteristics of laser gyroscopes obtained by Ukrainian firms. A theoretical model concerned with the physical phenomena of a ring laser with a 4-mirror resonator is created. Ring lasers are considered continuous, nonlinear self-excited oscillatory systems, that contain a number of limited and spatial nonuniform elements (active medium, diaphragms, mirrors). A model of laser generation that considers the effect of more than 40 resonator and amplifying medium parameters on laser output characteristics (intensity, frequencies difference, locking zone, etc.) was created. The mechanism that determines the mode selection and backscattering light from mirrors and diaphragms influence on the intensity and frequency difference of a traveling-wave in a ring laser is investigated. The mode formation mechanism (caustic or guide, or guide-caustic type) that depends on the resonator type and mirrors' dimension, radius of curvature and the channel shape and its linear dimensions can be achieved with the laser. It is shown, that the connection of the counter waves has a diffractive as well as a interference nature and is defined by the parameters of the resonator mirrors and diaphragms as well as by their disposition as to the amplifying medium. Using the latter, the methods and the devices that allow the decrease of the influence of the static zone of the waves lock on the output characteristics in 10-20 times has been created. Proceeding from the created mathematical model, the methods of optimization element composition and parameters of optical-physical scheme of the ring laser and the systems of stabilization and control of the laser generation regime of the laser gyroscope are worked out. The microprocessor systems for the laser gyroscope generation regime support and stabilization of its parameters during experimentation were completed. It is shown experimentally that laser gyroscope with such systems has a null drift 0.005 degree/hour and a random walk 0.003 degree/sq rt (hour).

The use of data recorders on-board aircraft for crash and later for maintenance and logistic purposes is well known. Due to higher requirements for safety and economy of ground transport vehicles operation, such devices are already used in selected types of these vehicles. The use of new technology - solid-state memories - enables the increase of technical parameters of such recorders (number of registered parameters, MTBF), reduces the mass, space and requirements on technical assistance during operation. In this paper a technical description of such recorders for aircraft and ground based vehicles is given. Also, results of recent applications of these devices and different methods and software for evaluation are also presented.

DESIGN, CONSTRUCTION AND CALIBRATION OF SENSORS FOR HPM MEASUREMENTS

Seregelyi, J. S., Defence Research Establishment Ottawa, Canada; Kashyap, S., Defence Research Establishment Ottawa, Canada; AGARD, High Power Microwaves (HPM), Volume 1; Mar 1, 1995, 11 p; In English; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

The measurement of High Power Microwave (HPM) coupling is an important diagnostic tool in the understanding of HPM interaction with complex structures. The quantities of interest include the electric and magnetic fields both in free space and at (or near) the surface of

a body. The sensors used must be small in order to cause minimal perturbation of the ambient field and to function over as wide a bandwidth as possible. In addition, the signal-to-noise ratio (SNR) must be as large as possible. This paper presents an engineering overview of the design and construction of various HPM sensors presently used at the Defence Research Establishment (DREO). Calibration methods for these sensors will also be briefly discussed.

Two sensors for a non-destructive testing of materials at low microwave frequencies are described. One is a resonant dielectric probe acting on a quasi-TEM mode at about 1.7 GHz. The other sensor is a microstrip system developed in the 0.5-2.5 GHz frequency range. The Finite Element Method (FEM) leads to the determination of resonant or propagation parameters of each sensor. The main basis of characterization methods is to compare the measurement values of the characteristic parameters of the sensors with the corresponding theoretical ones. Several tests of dielectric and magnetic materials are presented and confirm the validity of the two methods.

Instrumentation systems have always been essential components of world class wind tunnels and laboratories. Langley continues to be on the forefront of the development of advanced systems for aerospace applications. This paper will describe recent advances in selected measurement systems which have had significant impact on aerospace testing. To fully understand the aerodynamics and aerothermodynamics influencing aerospace vehicles, highly accurate and repeatable measurements need to be made of critical phenomena. However, to maintain leadership in a highly competitive world market, productivity enhancement and the development of new capabilities must also be addressed aggressively. The accomplishment of these sometimes conflicting requirements has been the challenge of advanced measurement developers. However, several new technologies have recently matured to the point where they have enabled the achievement of these goals. One of the critical areas where advanced measurement systems are required is flow field velocity measurements. These measurements are required to correctly characterize the flowfield under study, to quantify the aerodynamic performance of test articles and to assess the effect of aerodynamic vehicles on their environment. Advanced measurement systems are also making great strides in obtaining planar measurements of other important thermodynamic quantities, including species concentration, temperature, pressure and the speed of sound. Langley has been on the forefront of applying these technologies to practical wind tunnel environments. New capabilities in Projection Moire Interferometry and Acoustics Array Measurement systems have extended our capabilities into the

model deformation, vibration and noise measurement arenas. An overview of the status of these techniques and recent applications in practical environments will be presented in this paper.

Researchers continue to find new ways to employ holography to measure aerodynamic parameters in almost all flow regimes. Since holography provides a method to store optical wavefronts in such a fashion as to allow their reconstruction and analysis at a later time, it is a natural intermediate step for many conventional optical diagnostic procedures that employ interferometry, schlieren, deflectometry, particle image velocimetry, and three-dimensional visualization. For example, optical wavefronts representing one condition of a flow can be interfered directly with those representing a second condition, simply by storing the wavefronts holographically, providing at the same time a simple mechanism to subtract out all non varying conditions (such as optical defects). The result is a powerful method for the study of turbulent flow. These procedures have now been in use for many years and are reaching maturity, but the field is by no means stagnant. More recently, holographic techniques have been extended to include multiple wavelength recording holography at a wavelength tuned to include a resonance of a constituent in the flow, real-time holography (four wave mixing), and recording in photorefractive materials, SLM's, and CCD's. Also, new ways of using holograms to record, reconstruct and produce unique wavefronts for measurement have evolved. For example, holograms can be placed directly on a model surface to aid in measurement (optically smart surfaces). In resonance interferometry, sensitivity is enhanced by tuning the light to the resonance line of a substance, exploiting the large refractive index change caused by anomalous dispersion at resonance. Holography enhances this unique form of interferometry by allowing useful interference between two beams (of different wavelength) that pass through exactly the same paths at the same time. This further allows interferograms to be recorded in photorefractive materials in such a way that a cineholographic interferometry movie of the selected substance in the field of interest can be recorded. Four wave mixing (sometimes called real-time holography) provides a unique way to measure temperature in high pressure flows, where other optical methods usually fail. This paper will describe the principles behind holographic flow diagnostics with emphasis on the more recently developed methods, and will consider the future potential of holographic diagnostics in aerodynamics.

THE STATUS OF INTERNAL STRAIN GAGE BALANCE DEVELOPMENT FOR CONVENTIONAL AND FOR CRYOGENIC WIND TUNNELS

Ewald, B., Technische Univ., Germany; May 1998; 10p; In English; See also 19980203985; Original contains color illustrations; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The measurement of the aerodynamic forces is still the most important task in the wind tunnel at least for aircraft development work. Accuracy and reliability of the balance are key factors in this test technology. The urgent requirement for more and more accurate force testing leads to a demand for more and more balance accuracy. The most urgent demand in this field comes from the Cryogenic Tunnels like the NTF and the new European Wind Tunnel. The outcome of effort at the Darmstadt University of Technology is not only a cryogenic balance technology, which allows transport performance measurements in the ETW with a repeatability of less than one drag count with variable tunnel temperature but also a considerable improvement of balances for conventional tunnels. For this result all aspects of the balance technology had to be treated. For the balance design a

computerized method was developed, which allows an optimization of the structural design in a short time. Principal aspects of the design were studied with Finite Element analysis for optimized solutions. The technique of the electron beam welded balance was established successfully. This construction method gives considerable advantages with respect to design for optimum structure stiffness and low interference. The difficult problem of strain gaging and wiring for cryogenic environment with severe moisture conditions was solved as a result of lengthy efforts. For cryogenic balances a novel axial force measurement system was developed, which solves the problem of temperature gradient induced error signals. For residual errors of this type numerical correction methods are proven. For balance calibration a new strategy is used. A novel mathematical algorithm extracts a third order measuring matrix (no matrix inversion necessary) from the calibration data set. In a mathematical sense this is the best possible closed solution. In cooperation with Deutsche Airbus and the Carl Schenck Company a fully automatic calibration machine was developed for ETW. A smaller and simplified version of this machine is under construction at the Darmstadt University of Technology. Finite element analysis turned out to be a powerful tool in the development of optimized balance structures. Novel balance structures with minimized linear and non-linear interference and with minimized sensitivity against temperature gradients have been developed. For half model testing, which is a more and more important technique in transport development, compact half model balances have been developed and constructed. The crucial problem of temperature sensitivity of such balances was successfully solved by FEM optimization.

SUMMARY REPORT OF THE FIRST INTERNATIONAL SYMPOSIUM ON STRAIN GAUGE BALANCES AND WORKSHOP ON AOA/MODEL DEFORMATION MEASUREMENT TECHNIQUES

Tripp, John S., NASA Langley Research Center, USA; Tchong, Ping, NASA Langley Research Center, USA; Burner, Alpheus W., NASA Langley Research Center, USA; Finley, Tom D., NASA Langley Research Center, USA; May 1998; 12p; In English; See also 19980203985; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

The first International Symposium on Strain Gauge Balances was sponsored under the auspices of the NASA Langley Research Center (LaRC), Hampton, Virginia. Held at the LaRC Reid Conference Center, the Symposium provided an open international forum for presentation, discussion, and exchange of technical information among wind tunnel test technique specialists and strain gauge balance designers. The Symposium also served to initiate organized professional activities among the participating and relevant international technical communities. The program included a panel discussion, technical paper sessions, tours of local facilities, and vendor exhibits. Over 130 delegates were in attendance from 15 countries. A steering committee was formed to plan a second international balance symposium tentatively scheduled to be hosted in the United Kingdom in 1998 or 1999. The Balance Symposium was followed by the half-day, Workshop on Angle of Attack and Model Deformation on the afternoon of October 25. The thrust of the Workshop was to assess the state of the art in angle of attack (AoA) and model deformation measurement techniques and to discuss future developments.

With financial contributions from the Canadian Department of National Defence, the Structures, Materials, and Propulsion Laboratory of the National Research Council of Canada (NRC) established

a program for evaluating the effects of component deterioration on gas turbine engine performance. The effort was aimed at investigating the performance changes resulting from typical in-service faults. An important aspect of the engine test program was the use of non-intrusive sensors to supplement conventional instrumentation. Combined gas and metal thermal patterns in the infrared radiation spectra, recorded using infrared thermography, were used to evaluate gas path patterns to identify possible fault conditions. Exhaust plane thermal patterns can be classified as "healthy" for no-fault conditions, and "distressed" where known faults are in existence. Several defective engine components, including fuel nozzles, combustor cans, turbine nozzles, and thermocouple probes were used to evaluate the effectiveness of this technique on an engine test bed. This paper covers the project objectives, the experimental installation, and the results of the tests. Descriptions of the infrared thermography system, the data reduction and analysis methodology are also included.

This paper reports on some of the turbine surface temperature measurement techniques and instrumentation currently in use and under development in Rolls-Royce. Firstly, thermal paints are reviewed highlighting the development of new computer aided analysis and interpretation techniques. Thin film thermocouples are described with their applicability to gas turbine engine components, especially those with thin skins. Finally, the novel technique of photoluminescence thermometry using so-called "thermographic phosphors" is described. Examples of measurements on static engine components and developments for measurements on rotating turbine blades are given.

This paper presents an overview of current research efforts aimed at improving turbine engine structural instrumentation capabilities. Emphasis is placed on nonintrusive concepts which will be applicable to the advanced engines currently in use, or being designed for initial operational testing shortly after the turn of the century. Technologies to be described include; blade tip deflection sensors to determine dynamic stress, thermographic phosphors to measure metal temperature, pressure sensitive paints and air etalons to measure dynamic pressure, and micro electro mechanical systems to assess a variety of parameters. Advantages of the various systems, potential problems and limitations, as well as, an assessment as to their applicability to either the Integrated High Performance Turbine Engine Technology or the High Cycle Fatigue initiative is discussed.

Overcoat protection schemes for thin film devices have typically focused on inhibiting the growth of native oxides formed on the sensor surface, rather than on improving the passivating nature of these native oxides. Here, thin sputtered Cr overcoats and heat treatments in varying oxygen partial pressures enhanced the passivating nature of native Cr₂O₃ films formed on PdCr thin film strain gages. Results of strain tests using sensors protected using this approach are presented and the implications are discussed. PdCr gages with sputtered Cr overcoats withstood 12,000 dynamic strain cycles of 1100 micro-epsilon during 100 hours of testing at a temperature of 1000 C in air. Gage factors of 1.3 with drift rates as low as 0.1 Omega/hr were achieved for devices having a nominal resistance of approximately 100 Omega's. TCR's ranging from +550 ppm/C to +798 ppm/C were realized depending on the overcoat and thermal history. Possible mechanisms for an anomaly in the electrical characteristics of these films at 800 C and improvements in stability due to the use of overcoats are presented.

A stable, high temperature strain gage based on reactively sputtered indium tin oxide (ITO) was demonstrated at temperatures up to 1050 C. These strain sensors exhibited relatively large, negative gage factors at room temperature and their piezoresistive response was both linear and reproducible when strained up to 700 micro-in/in. When cycled between compression and tension, these sensors also showed very little hysteresis, indicating excellent mechanical stability. Thin film strain gages based on selected ITO alloys withstood more than 50,000 strain cycles of +/- 500 micro-in/in during 180 hours of testing in air at 1000 C, with minimal drift at temperature. Drift rates as low as 0.0009%/hr at 1000 C were observed for ITO films that were annealed in nitrogen at 700 C prior to strain testing. These results compare favorably with state of the art 10 micro-m thick PdCr films deposited by NASA, where drift rates of 0.047%/hr at 1050 C were observed. Nitrogen annealing not only produced the lowest drift rates to date, but also produce the largest dynamic gage factors ($G = 23.5$). These wide bandgap, semiconductor strain sensors also exhibited moderately low temperature coefficients of resistance (TCR) at temperatures up to 1100 C, when tested in a nitrogen ambient. A TCR of +230 ppm/C over the temperature range 200 C < T < 500 C and a TCR of -469 ppm/C over the temperature range 600 C < T < 1100 C was observed for the films tested in nitrogen. However, the resistivity behavior changed considerably when the same films were tested in oxygen ambients. A TCR of -1560 ppm/C was obtained over the temperature range of 200 C < T < 1100 C. When similar films were protected with an overcoat or when ITO films were prepared with higher oxygen contents in the plasma, two distinct TCR's were observed. At T < 800 C, a linear TCR of -210 ppm/C was observed and at T > 800 C, a linear TCR of -2170 DDm/C was observed. The combination of a moderately low TCR and a relatively large gage factor make these semiconducting oxide films promising candidates for the active strain elements in high temperature thin film strain gages, particularly in applications where static strain measurement is desired.

The potential application of a Two-Color Digital-Particle-Image-Velocimetry (DPIV) system to turbomachinery-type flows was evaluated. This system records double-exposed color images onto a single CCD sensor (3060 x 2036 pixel) and eliminates the photographic-film processing time and subsequent digitization time as well as the complexities associated with conventional image-shifting techniques. The system was calibrated using simulated known displacements and gradients and was applied to the flowfield in a 20-in.-dia. axial fan. DPIV implementation issues such as optical access, seeding strategies, and blade-passage synchronization related to turbomachinery flows were explored. Instantaneous velocity measurements were made at different spanwise locations. These measurements provided instantaneous information on the blade wake region, the flow separation off the blades, and the interaction between successive blades and also allowed a greater understanding of the impact of these phenomena on turbomachinery performance.

Particle Imaging Velocimetry (PIV) is a powerful measurement technique which can be used as an alternative or complementary approach to Laser Doppler Velocimetry (LDV) in a wide range of research applications. PIV data are measured simultaneously at multiple points in space, which enables the investigation of the non-stationary spatial structures typically encountered in turbomachinery. Many of the same issues encountered in the application of LDV techniques to rotating machinery apply in the application of PIV. Preliminary results from the successful application of the standard 2-D PIV technique to a transonic axial compressor are presented. The lessons learned from the application of the 2-D PIV technique will serve as the basis for applying 3-component PIV techniques to turbomachinery.

STRIPPING BY LASER

Malavallon, Olivier, Aerospatiale, France; AGARD, Environmentally Safe and Effective Processes for Paint Removal; Apr 1, 1995, 4 p; In English; See also 19950025744; Copyright; Avail: CASI; A01, Hardcopy; A01, Microfiche

Laser beam stripping can be achieved using several active materials: YAG, CO₂ Tea, or Excimer. The YAG laser appears to be the most efficient laser assessed in this report. However, the results obtained for productivity, quality, and type of stripping were very poor. Also, for stripping and on account of its specifications, the laser beam can only be used in an automated manner. In spite of these results, it seems that certain companies in Europe have recently developed technical solutions allowing better results to be obtained.

An ultra-short pulse, millimeter-wave free electron maser experiment is currently underway at UC Davis and Lawrence Livermore National Laboratory. A 8.5 kG, 30 mm period helical wiggler is used to transversally accelerate a train of one hundred 5 MeV, 0.25 nC, 1 ps duration micro bunches synchronously energized by a 20 MW, X-band photocathode RF linac. The photocathode is irradiated by a burst-mode, UV laser system which produces up to 100 pulses at 207 nm, with an energy of 10 mJ/pulse, and a pulse duration of 200 fs, at a repetition rate of 2.142 GHz. This system includes a 400 fs jitter synchronously modelocked AlGaAs semiconductor laser oscillator which is amplified by an eight-pass Ti:Al₂O₃ chirped pulse laser amplifier. The output of this amplifier is subsequently frequency quadrupled into the UV. Because the electron micro bunches are shorter than the radiation wavelength, the system coherently synchrotron radiates and behaves essentially as a prebunched FEM. In addition, by operating in a waveguide structure at grazing, where the bunch axial velocity in the wiggler matches the group velocity of the electromagnetic waves, one obtains output radiation pulses which are extremely short, and have greatly enhanced peak power. The device operates in the TE(sub 12) mode of a cylindrical waveguide, and will produce up to 2 MW of coherent synchrotron radiation power at 140 GHz, in a 15 ps FWHM pulse. The -3 dB instantaneous interaction bandwidth extends from 125 GHz to 225 GHz. The output pulse is chirped over the full interaction bandwidth. One of the major potential applications of such a device is an ultra-wideband millimeter-wave radar.

LIDAR MEASUREMENTS OF REFRACTIVE PROPAGATION EFFECTS

Philbrick, C. R., Pennsylvania State Univ., USA; Blood, D. W., Pennsylvania State Univ., USA; AGARD, Propagation Assessment in Coastal Environments; Feb 1, 1995, 13 p; In English; See also 19960007226; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

A multi-wavelength Raman lidar has been developed and used to measure the profiles of atmospheric properties in the troposphere under a wide range of geophysical conditions. The instrument measures the two physical properties which contribute to the refractive index at radio frequencies, water vapor concentration profiles from vibrational Raman measurements and neutral density determined from rotational Raman temperature profiles and surface pressure. The LAMP lidar instrument is transportable and has been used to make measurements at several locations in addition to our local Penn State University site, including shipboard measurements between Arctic and Antarctic and in the coastal environment at Point Mugu, CA. Lidar measurements of the atmospheric refractive environment, which are of particular interest, were made during 1993 at Point Mugu, CA, including the period of Project VOCAR (Variability of Coastal Atmospheric Refractivity). Both the lidar and balloon tropospheric measurements have been used for analyses of the propagation conditions by employing the Navy's RPO, IREPS and EREPS PC programs and comparisons have been made with the measured propagation conditions. On the short term (hour-to-hour throughout the day), the lidar derived profiles permit the examination of refractive layer stratification for guided-wave mode propagation.

DEVELOPMENT AND APPLICATION OF LASER INDUCED INCANDESCENCE (LII) AS A DIAGNOSTIC FOR SOOT PARTICULATE MEASUREMENTS

Snelling, D. R., National Research Council of Canada, Canada; Smallwood, G. J., National Research Council of Canada, Canada; Campbell, I. G., National Research Council of Canada, Canada; Medlock, J. E., National Research Council of Canada, Canada; Guelder, O. L., National Research Council of Canada, Canada; May 1998; 10p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

LII is a promising diagnostic for in-situ measurements of particulates. The LII signal is shown to be proportional to soot volume fraction. Due to the large dynamic range of the LII technique, we have been able to measure time averaged soot concentrations in the part per billion range with a spatial resolution of approx. 0.5 mm in each dimension. The decay of the LII signal in the post evaporative region is shown to be a sensitive measure of primary particle size. A numerical model has been developed which accurately predicts post evaporative LII signal decay rates. The prediction of the excitation curve is unsatisfactory, with more work needed to correctly model the particle behaviour during the soot evaporation phase. Also, the model predicts that the prompt LII signal will vary as the 3.33 power of particle diameter. However, this predicted departure from strict proportionality between LII signal and soot volume fraction was not experimentally observed.

Laser-induced iodine fluorescence, referred to as LIIF, is a non-intrusive optical method which allows one not only to visualize a flow, but to obtain local and instantaneous magnitudes such as pressure, temperature, and speed. Following confirmation in a static tube in which the parameters P and T are easily measurable, some measurements of the three parameters were taken on a supersonic jet by using a gaussian multimode laser and a tunable single mode dye laser.

Planar Laser Induced Fluorescence (PLIF) offers advantages over mechanical patternators, gas sampling, and other laser diagnostics in providing high resolution instantaneous two-dimensional images of liquid and vapour fuel concentration in operating gas turbine combustors. The technique has been developed at Cranfield and successfully applied to three different situations. Firstly the power of the method for fundamental mixing studies is illustrated with respect to a simple jet mixing experiment. Secondly the practical application of the method to an atmospheric pressure LPP combustor and a high pressure double annular combustor are presented. Radial and axial

imaging of both the liquid and vapour phases has been performed with fuel markers that are capable of distinguishing between different boiling-point fractions. Such data allows investigation of the fuel-air mixing in the combustor, as well as the behaviour of the spray cone angle and patterning with varying fuel rate.

The USA Air Force Research Laboratory is conducting a program to develop a wideband airborne laser data link. The program successfully ground demonstrated a 1.1 gigabit/second (sec) full duplex data link over a distance of 150 kilometers (km). This ground demonstration was accomplished in Hawaii in September 1995. The system used in the ground demonstration has been redesigned and will be installed in two jet aircraft for flight demonstration at distances up to 500 km. These demonstration flights will begin in September 1998.

LASER POWER BEAMING: AN EMERGING NEW TECHNOLOGY FOR POWER AND PROPULSION IN SPACE

Bennett, H. E., Advisory Group for Aerospace Research and Development, France; Schadow, K. C., Editor, Advisory Group for Aerospace Research and Development, France; Aerospace 2020; Sep. 1997; Volume 3, 99-103; In English; See also 19990014353; Copyright Waived; Avail: CASI; A01, Hardcopy; A02, Microfiche

The potential of laser power beaming from a ground-based laser to satellites is discussed. The laser power may be used for propulsion and to increase the electric power available from the satellite. The increase relative to solar power generation can be an order of magnitude using the same size solar panels. For propulsion, it is proposed to beam the laser power through the atmosphere to a "tug satellite" which carries launched satellites to a higher orbit. The increased satellite electric power may be used to provide surge power to inhibit jamming of satellites in wartime, to overcome the increased atmospheric absorption in microwave operations, to provide orbit changes or corrections, to extend station keeping and satellite lifetime, and to transport malfunctioning satellites to the Space Station for repair and reinsertion in orbit. Key elements in the proposed concept include a 100 to 200 kW free-electron laser, a 3 km long underground ultra-high vacuum tube and a novel adaptive optical telescope. All elements in the concept have either been demonstrated or prototyped.

DYNAMIC RESPONSE OF A CRYOGENIC LOX PUMP TO PRESSURE AND MASSFLOW FLUCTUATION

Munari, A., Fiat Aviazione S.p.A., Italy; Motta, M., Fiat Aviazione S.p.A., Italy; Loss Mechanisms and Unsteady Flows in Turbomachines; Jan. 1996; 8p; In English; See also 19960024804; Copyright Waived; Avail: CASI; A02, Hardcopy; A06, Microfiche

During the first stage flight many liquid propellant rockets have experienced longitudinal vibrations caused by interaction between the first launcher longitudinal mode and the dynamic of the propulsion system. This type of instability, called POGO, is closely related to the feeding pumps dynamic characteristics, especially when working at the lowest suction pressure. The knowledge of the pump dynamic response to pressure and mass flow oscillations is essential for the prediction and analysis of the POGO phenomena. The necessary information can be represented in form of a pump-transfer-matrix, which relates the fluctuating pressure and mass flow at pump inlet to the same quantities at pump discharge. This work summarizes the results of the experimental activities performed to extract the dynamic transfer matrix of a liquid oxygen pump in both cavitating and non cavitating conditions.

Fretting and wear of hinges, tracks, bearings, and gearboxes in airframes and engines is a constant problem for aircraft or other defense systems, as they induce failures and jamming, necessitating costly in-service inspections and replacement of parts. At the 82nd Meeting of the AGARD Structures and Materials Panel a Specialist's Meeting was held on Tribology for Aerospace Systems. The meeting was split into three sessions (18 papers): (1) new technologies such as coatings, new materials, lubrication and their behavior; (2) practical applications in airframes and their mechanical systems; and (3) practical applications to engines, both jet engines and reciprocal engines. The meeting was ended by a round table discussion.

THIN FILM LUBRICATION OF NON-SMOOTH SURFACES

Jacobson, Bo, SKF Engineering and Research Centre, Netherlands; Tribology for Aerospace Systems; Oct. 1996; 8p; In English; See also 19970006808; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

The reliable performance of heavily-loaded mechanical contacts can only be sustained over long periods when a lubricant film fully separates the two bodies and asperities do not interact. Engineering surfaces do have a certain degree of roughness and this would then determine the required thickness of the lubricant film. Unfortunately, thick lubricant films have disadvantages such as high power losses (oil churning) or they may not be attainable because of prescribed lubricants or high operating temperatures. In order to optimize the quality of the surface against these conflicting requirements, or in order to design specific surfaces for extreme operating conditions, a thorough understanding of the mechanisms of micro EHL or asperity lubrication

is needed. This required level of understanding goes beyond the current one which employs Λ , the ratio between calculated film thickness and combined surface roughness. When detailed analysis of the behavior of surface asperities in heavily-loaded elastohydrodynamic contacts includes non-Newtonian effects, two phenomena become evident. One phenomenon is the possibility to describe theoretically the collapse of an oil film and to determine when a lubricated rough surface in contact with another surface can come into solid contact through the lubricant film. The other phenomenon, which is closely related to the first one, is the explanation of the well-known fact that the oil film thickness needed to separate two elastohydrodynamically lubricated surfaces is strongly dependent on the structure of the surface roughness and not only on the values of the different surface roughness parameters. Both of these phenomena can only be explained if the pressure distribution in the lubricant film has such high frequency variation that local asperities in the lubricant film become elastically deformed by the pressure distribution, making the contact surfaces conform much more than in the unstressed state outside the high pressure contact zone.

Slip-rolling testing of ceramic samples for friction and wear was done in a twin disc tribometer of the Amsler-type at 3 GPa. Lubricant water and paraffin oil without any additives was used. The surface of the ceramics were machined with different processes, resulting in different surface roughnesses (i.e. rough and fine honed, rough and fine grounded, rough and fine lapped and rough and fine polished). Ceramic materials like HIP-Si₃N₄ (NBD 200), SiC (EKasic D) and Si₃N₄-TiN (EDM) were investigated. HIP-Si₃N₄ and Si₃N₄-TiN in paraffin oil generally show a small wear coefficient in the range of 10(exp -9) cu mm/Nm. In paraffin oil, the wear coefficient of Si₃N₄ and Si₃N₄-TiN correlates to the initial surface roughness and the material removal rate. The wear coefficient in water is for both materials higher by two orders of magnitude. The surface of the SiC components shows pitting after the tribological tests, independent from the ambient media.

TRIBOLOGICAL PROBLEMS IN SPACECRAFTS

Borrien, A., Centre National d'Etudes Spatiales, France; Tribology for Aerospace Systems; Oct. 1996; 10p; In English; See also 19970006808; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

Spacecraft are very specific vehicles which have to work over a long period of time after experiencing severe mechanical stresses, without any maintenance and in a harsh environment, quite difficult to reproduce on ground. Economic constraints leading to the mass minimization and the low power availability complete the quick description of a situation propitious to mechanisms failures. The tribological problems are then the crucial point to assess in order to control in orbit mechanisms behavior, and this will require a good knowledge of kinematics, materials, relative velocities and contact pressure. Increasing complexity of payloads (especially in the field of optical instruments), microvibration requirements needed for satellite attitude stability, fifteen-year service life, deployment and pointing of very large appendages (as for radar missions) point out the wide range of satellite mechanism requirements. The aim of this paper is to present the features of the space environment, the tribological solutions achieved by current programs, and the limits of these technologies. The surface adhesion due to ultra-vacuum, materials outgassing, the problem of thermal regulation, and the difficulties of controlling fluid lubricants migration under microgravity are discussed. We show that the neces-

sity of ground tests and the constraints brought by the launch vibrations could highly influence the chosen solution. The main onboard functions calling for a mechanism are briefly described and are taken as actual examples for the description of the family of dry and wet space lubricants. Some general recommendations for space tribology are given in the last part, and the research and technology program performed in Europe under CNES and ESA funding is briefly discussed.

Plastics-based liners, 0.3-0.4 mm thick, containing polytetrafluoroethylene are usually mated against steel counterfaces in dry bearings used extensively in aircraft and helicopters. Wear experiments have been made on a number of these liners, using a tri-pin on disc apparatus, to examine the effect of decreasing the roughness of the steel and other counterfaces manufactured from harder materials and coatings. For some hard materials, WC-Co and alumina, the primary importance of hardness and surface roughness on liner wear is confirmed; the smoother the surface the lower the wear. Other materials, and in particular physical vapor deposited titanium nitride, do not lead to lower liner wear rates. The very low liner wear obtained against cermet and alumina counterfaces suggest that bearing lives could be extended considerably, perhaps by an order of magnitude, by using harder counterfaces than the hardened AISI 440C stainless steel which is currently used.

EHD ANALYSIS OF A ROLLER/INNER RING CONTACT IN A JET ENGINE ROLLER BEARING

Seabra, J., Porto Univ., Portugal; Campos, A., Porto Univ., Portugal; Tribology for Aerospace Systems; Oct. 1996; 12p; In English; See also 19970006808

Contract(s)/Grant(s): Aero-0007-A(c); Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

This paper deals with the analysis of an EHD (elastohydrodynamic) roller/inner ring contact in a roller bearing for a jet engine application. The equations for the EHD lubrication problem, with longitudinal roughness, and their numerical solution for a Newtonian fluid are presented. A typical geometry of a jet engine roller bearing is studied in detail, both in terms of lubricant film thickness and of elastic deformation of the roller. The results obtained show that the geometry of the roller in the transverse direction, produces a contact area of particular shape, avoiding the appearance of significant edge overpressures, independently of the operating conditions. The influence of the load and rolling speed on the film thickness, both for smooth and wavy surfaces, was also investigated. The results obtained support the conclusion that the surface waviness considered produce a small decrease of the film thickness, when compared with the smooth case, and that the elastic deformation of the waviness is strongly dependent on the rolling speed. Finally a correlation of the EHD film thickness results for the the roller/inner ring contact is obtained and compared with known solutions.

ROLLING CONTACT TESTING OF VAPOR PHASE LUBRICANTS

Forster, Nelson H., Wright Lab., USA; Tribology for Aerospace Systems; Oct. 1996; 8p; In English; See also 19970006808; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

Material screening tests have been performed with four candidate vapor phase lubricants under rolling contact conditions. The lubricants evaluated were: t-butyl phenyl phosphate (TBPP), polyalphaolefin (PAO), cyclophosphazine (X-1P), and PAO blended with 15

percent TBPP (PAO+). A factorial analysis was used to separate the effects of lubricant; bearing steel, T15 vs. thin dense chrome coated T15; cage material, AISI 4340 vs. Monel 400; and ball material, T15 vs. NBD 200 Si3N4. Response variables included in the analyses were the bearing friction coefficient, wear rate, and life under accelerated conditions. The type of lubricant was significant at the 90 percent confidence level for all three response variables, with the PAO+ and TBPP showing the best results. In general, bearing materials containing Fe showed improved performance over materials which do not contain Fe at the bearing surface.

19970006822 Turbomeca S.A. - Brevets Szydlowski, Bordes, France **THE RELIABILITY OF THE BEARINGS OF SMALL AND MEDIUM TURBINES BEING MORE AND MORE DEPENDENT ON TRIBOLOGY LA FIABILITE DES ROULEMENTS DES PETITES ET MOYENNES TURBINES DE PLUS EN PLUS DEPENDANTE DE LA TRIBOLOGIE**

Paty, Gerard, Turbomeca S.A. - Brevets Szydlowski, France; Cheftel, Brigitte, Turbomeca S.A. - Brevets Szydlowski, France; Tribology for Aerospace Systems; Oct. 1996; 10p; In French; See also 19970006808; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

Bearings reliability in the mechanical industry was in the past very dependent on material fatigue. Because of their high speed, aeronautical applications added high friction conditions and then generated more surface damages. The important progress made with steel quality, particularly with vacuum elaborated types used in aeronautics now prevent most of the classical deep initiated fatigue failures. Defect initiation moved toward the contact surface which therefore becomes the research and development center of interest of the future. The high speed bearings are lubricated in the most effective manner. The creation of an oil film which separates the surfaces is essential to avoid metal to metal contact. New computer codes such as BEDALES and QUASAR, developed with the support of the European Community during the last years, led to a better understanding and prediction of this behavior. Nevertheless turbine engines continue to suffer defects whose initiations are often linked with tribological weaknesses. Skidding is one of the most important. It depends widely on material surface temperature capacity. Pollution of oil systems with hard particles is another source currently being investigated in terms of damage tolerance. Bearing cages also have to withstand severe contact conditions which overlap the capacity of the current technology. Surface and subsurface stresses have an essential role in the control of the fatigue failure initiation and development. The investigations on a set of used bearings with new NDT techniques as Barkhausen noise show promising information for developing new tools in this area.

19970006823 Motoren- und Turbinen-Union G.m.b.H., Munich, Germany **AIRSEALS FOR ADVANCED MILITARY JET ENGINES**

Uihlein, T. J., Motoren- und Turbinen-Union G.m.b.H., Germany; Tribology for Aerospace Systems; Oct. 1996; 20p; In English; See also 19970006808; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

In advanced military jet engines airseals represent one of the most challenging key technologies. Without properly functioning seal systems it is not possible to attain the high pressure ratios needed for high efficiencies and low specific fuel consumption. Moreover a poorly functioning seal system can result in blade losses and titanium fire, or in heavy damage to the rotor in the case of labyrinth seals, which is even more dangerous. To overcome these problems a basic understanding of the wear mechanisms of the different seal systems is necessary. This requires rub testing under simulated engine conditions to determine the limitations of each system. Only with this knowledge can the design and improvement of abrasives, fin coatings or tip coatings be successful. Apart from abrasability this optimization

also includes, for example, erosion resistance, high cycle fatigue strength of tip coated blades, or damage tolerance of abrasives against blade passing frequencies.

HIGH TEMPERATURE TRIBOLOGY FOR FUTURE DIESEL ENGINES

Bryzik, Walter, Army Tank-Automotive Research and Development Command, USA; Kamo, Roy, Adiabatics, Inc., USA; Tribology for Aerospace Systems; Oct. 1996; 8p; In English; See also 19970006808; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

Diesel engines will be operated at higher cycle temperatures in the future. The higher cycle creates problems of the top ring, piston, valve seats, valve guides, and cylinder liner. Current lubricating oil with thermal oxidative stability of 204 C is inadequate. Polyol ester base formulated synthetic oil such as Stauffer Chemical SDL-1 or US TACOM MRI-1 with 310 C thermal oxidative stability could possibly be the next generation lubricating oil. However, as diesel engines designed to include advanced structural ceramics or composites for 'adiabatic' operation become feasible, the thermal stability of the lubricating oil will approach 445 C. to withstand the top ring reversal temperature beyond 310 C, polyphenol ester base oil and other high temperature liquid lubricants will be sought. The highly aromatic polyphenol ether type oil has thus far shown very little promise. The hybrid piston with solid lubricated top compression rings and a hydrodynamically lubricated oil ring has shown encouraging results. It can be designed to offer as much as 150 C higher top ring reversal temperature capability. If higher hydrodynamically lubricated oil becomes available, the top ring reversal temperature can also be elevated by a temperature difference of approximately 150 C. The hybrid piston conceptually drags a thin oil film into the upper dry solid lubricated cylinder liner regions by traversing through the hydrodynamic lubricated region during bottom dead center travel. This small amount of oil film is sufficient to form a hard thin film lubricant of very low coefficient of friction. Densified Cr2O3 coating on Cr2O3 coating has demonstrated the possibility to operate at 380 C top ring reversal temperature with acceptable wear and life. NASA PS212 with Stellite 6B was also tested without liquid lubricant.

TRIBOLOGICAL ASSESSMENTS AND CONCEPTS FOR AN OILFREE INTERNAL COMBUSTION ENGINE

Woydt, M., Federal Inst. for Materials Research and Testing, Germany; Tribology for Aerospace Systems; Oct. 1996; 14p; In English; See also 19970006808; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

Unlubricated engines can be realized from the tribological point of view, if wear coefficients of sliding couples lower than 5×10^{-8} cu mm/(N m) can be demonstrated, which are independent from ambient temperature and sliding speed. A review of published tribological data and a database search provided no couples with such a low wear coefficient at 22 C and 400 C. Known unlubricated sliding couples with wear coefficients around 10^{-7} cu mm/N m open the frame to build up such engines for basic studies.

This report provides a review and capability projection for a number of propulsion technology topics that could ensure and significantly enhance NATO air dominance well into the next century. The main topic deals with a 'Hypersonic Air Breathing Missile' that discusses in an exemplary way the military uses and technology requirements for a new weapon with unprecedented capabilities. This hypersonic missile, traveling at speeds between Mach 6-8, could be used as a medium distance weapon against hardened ground targets, very high value aerial targets, or time critical targets such as mobile theater ballistic missile launchers. Launched from the ground or air, it would cover up to 1500 kilometers in about 15 minutes and be virtually indefensible due to its hypersonic speed. The critical technology is the scramjet engine operating on a liquid hydrocarbon fuel that permits immediate launch and full control of engine power throughout the flight path. Detailed application and technology requirements are described. Maintaining air dominance in the battlefield is predicated on controlling the air space with a variety of air vehicles and missile systems; these are generally powered by gas turbine engines and rocket motors. Gas turbines will continue to be the most cost effective propulsor that can provide the necessary power for maneuverability, armament control and mission flexibility. Rocket engines offer very high specific power that is a fundamental requirement for many types of missiles and boosters. A technology development survey is given that briefly describes the considerable improvements to be expected in performance and economics. Doubling the range and halving the reaction time for fighter and global strike aircraft, and increasing by 50% the reach of global transport aircraft are well within sight. Three examples are given that introduce or foster new types of propulsion. The pulse detonation wave engine offers a marked increase in efficiency and a simplification of design over current rocket and ramjet engines. Gun projectiles may be driven electrically or by liquid charges, both of which promise to overcome the limitations posed by high energy solid propellants. Laser power beaming offers a means of transferring energy to vehicles over large distances. Despite the immense technological complexity, it may open entirely new roads for powering aerial vehicles in the more distant future. First applications may be in repowering satellites for extended operations and shifting of orbits. These technology and application reviews were originally developed under the auspices of the AGARD Aerospace 2020 Study. They are based on input from the AGARD Propulsion and Energetics and other Panels, the Aerospace Applications Study Committee of AGARD, and many contributions from outside AGARD. This report is but one example of the value that AGARD has provided to the military community, often at very short notice, over the past 45 years of its history. Derived from text

The two phase flow in the nearfield of an airblast atomizer in a cylindrical confinement was investigated with a three component (3D) dual mode Phase Doppler Anemometer (PDA). An algorithm for the calculation of the mass flux in a strongly swirling spray was derived. The algorithm makes use of all three velocity components. The improved performance relative to a 2D-algorithm is shown for an atmospheric spray. The error of the integrated mass flux is about +/- 15%

at a distance of more than 10 mm behind the nozzle exit. The investigations were made in an attempt to get first information on the two phase flow under real pressure condition where the dense spray starts to modify the flow pattern and hence the fuel distribution. Similarity rules were derived for scaling the combustor idle condition with respect to the particle number concentration in the spray. The measurements were made under atmospheric and simulated pressure condition. The measured spray properties agreed well with the expected results calculated from the similarity rules. Several effects of the spray on the gas phase were identified under simulated pressure. A reduced turbulence of the gasphase, a decreased dispersion of the spray and a degradation of the effective swirl number were identified as dense spray effects. These phenomena are likely to occur under real pressure as well. Other effects identified were results of the particle inertia. For the correct interpretation of the results it was necessary to estimate the degree to which the particle behaviour is influenced by its inertia under simulated and real pressure. Together with this evaluation the simulation of real engine condition with respect to the particle number concentration was successful within certain limits.

DIAL MEASUREMENTS ON A GAS TURBINE EXHAUST

Brundish, K. D., Defence Research Agency, UK; Wilson, C. W., Defence Research Agency, UK; Moncrieff, J. T. M., Spectrasyne Ltd., UK; May 1998; 8p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

This paper summarises work undertaken by Defence Evaluation and Research Agency (DERA) and SPECTRASYN, and examines the technique of DIAL as a measurement of gas turbine engine emissions. The work was jointly funded by the UK MOD and UK DTI. The DIAL technique is based on LIDAR, which is a laser based range finding system, similar to RADAR. With the use of a tuneable laser it can be adapted for spectroscopic measurements of mass flux. This technique was used to measure NO(x) and unburnt hydrocarbon mass fluxes from the vertical engine detuner, for two engines at three running conditions. The NO(x) measurements were converted to vppm values at the engine exit plane to allow comparison with intrusive probe measurements. The DIAL measurements of NO(x) at idle and max. continuous were within 25% of the probe measurements. The DIAL measurements are performed at a plane downstream of the detuner exit, and rely on the wind to move the plume through this plane. Low wind speeds which are usually associated with variable wind directions, can result in increased uncertainty. However, minimum reheat values were considerably different, and cannot be explained by these uncertainties. This anomaly is as yet unresolved, although a possible solution may be from continued reactions in the detuner. The unburnt hydrocarbon (UHC) measurements from both DIAL and the probe exhibited the same trends, although a direct comparison was not possible due to the unknown composition of the hydrocarbons exiting the engine. This made it impossible to calculate concentration from the mass flux measurements. Further work on gas turbine engines should be performed under less arduous conditions for DIAL measurements than the reported tests. Measurements in open areas directly behind the engine with a horizontal plume, offers the best conditions.

UV ABSORPTION MEASUREMENTS OF NITRIC OXIDE COMPARED TO PROBE SAMPLING DATA FOR MEASUREMENTS IN A TURBINE ENGINE EXHAUST AT SIMULATED ALTITUDE CONDITIONS

Howard, R. P., Sverdrup Technology, Inc., USA; May 1998; 10p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Nitric oxide measurements were conducted in the exhaust of a turbofan engine at simulated altitude conditions in a ground-level test cell using both optical nonintrusive and conventional gas sampling

techniques. NO-UV absorption measurements, using both resonance and continuum lamps, were made through several chords of the exhaust flow near the nozzle exit plane as a part of a larger effort to characterize aircraft exhaust constituents over a wide range of steady-state engine operating conditions. This paper describes the NO-UV absorption measurements and compares radial profiles of NO concentrations and emission indices with measurements obtained using conventional gas sampling and tunable diode laser infrared absorption.

The further development of turbomachines is driven by the improved understanding of the three dimensional, secondary flow processes. Therefore experimental data are needed to analyse the 3D flow in this machines and to provide data for computer code validation. In this context a 3D-L2F velocimeter was developed which enables 3D flow vector measurements under the difficult conditions of turbomachines where the optical access is restricted. The new design of the 3D-L2F velocimeter includes also a special multi-colour set-up with selectable beam separation that helps to reduce measurement time especially in turbulent flow regions; where conventional L2F systems are working rather time consuming. A special seeding probe which can be placed very close to the turbomachine inlet without generating flow distortions provides an increase of the particle concentration in the seeded streamline that passes the L2F probe volume, thus contributing also to a further measuring time reduction. Flow investigations in a transonic compressor are described and selected results of the secondary flow field obtained are presented.

Temperature results of three measuring campaigns with the mobile CARS system of the DLR Stuttgart are presented. The experiments were performed on different combustion chambers: a thrust nozzle test facility, a RQL combustor, and a ramjet combustor. Single pulse CARS N₂ thermometry was used to characterize the homogeneity of the flame at the exit plane of the combustion chamber, to address the quality of mixing of fuel-rich burnt gas of the primary zone with secondary air, to find an improved design for the H₂ injection into a high speed air flow, and to measure the temperature and pressure variations in the shock controlled free jet flame. In the last case both the temperature and the pressure could be determined from the CARS spectrum.

TURBOMACHINERY BLADE TIP MEASUREMENT TECHNIQUES

Heath, S., Rolls-Royce Ltd., UK; Slater, T., Rolls-Royce Ltd., UK; Mansfield, L., Rolls-Royce Ltd., UK; Loftus, P., Rolls-Royce Ltd., UK; May 1998; 10p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The efficiency of axial flow compressors and turbines is critically dependent on the size of the tip to casing gaps (tip clearance) as is the surge margin of compressors. Optimisation of tip clearance control schemes requires measurements of tip clearances throughout the operating envelope of the engine. The dynamic design of rotor blading to avoid damaging integral order and self excited resonance's is complex and still defies routine right-first time design. This necessitates monitoring of blade vibration during testing which is time consuming and costly with conventional strain-gauging techniques. Both of the above requirements may be addressed by easily mounted tip probes, the design and operation of which are discussed in this paper. Until recently the market for such devices has provided insufficient incentive for instrumentation suppliers to invest in the development of such devices leaving engine manufacturers to develop their own solutions to these unique problems. The Rolls-Royce experience is described.

NON-DESTRUCTIVE DETECTION OF CORROSION FOR LIFE MANAGEMENT

Bruce, David A., Defence Research Agency, UK; AGARD, Corrosion Detection and Management of Advanced Airframe Materials; Jan 1, 1995, 8 p; In English; See also 19950017076; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

In recent years, aircraft operators have been driven to increased use of Non-Destructive Evaluation (NDE) to ensure airworthiness during life extensions for ageing aircraft or as an integral part of a damage tolerant lifting philosophy. Major airframe static and fatigue tests are routinely used to highlight problem areas on airframes where design limitations or changes of usage may lead to early failures. The results of such tests become progressively less reliable as the age of the airframe increases and the operating conditions diverge from those under which the tests were conducted. Increased inspection, whether by visual or other means is usually the only alternative to wholesale refurbishment or replacement of aircraft or components. Almost all of the development to date of NDE techniques for corrosion detection and characterization has been concentrated on existing airframe materials, principally Aluminum alloys and steels. The current capabilities of corrosion detection techniques will be reviewed and current research aimed at areas where there is a requirement for

improved detection capability will be described. New materials, such as Polymer Matrix Composites, will experience different types of 'corrosive' deterioration. The capability of NDE methods to detect material degradation in new composite materials will be discussed. Finally, reliance on NDE, choice of NDE technique and optimal scheduling of inspections all require an assessment of the reliability of NDE methods. It will be shown that a range of NDE techniques with differing capabilities and characteristics will be required to ensure compatibility with maintenance schedules if full use is to be made of NDE for life management of structures which may be subject to corrosion.

EDDY CURRENT DETECTION OF PITTING CORROSION AROUND FASTENER HOLES

Heida, J. H., National Aerospace Lab., Netherlands; Thart, W. G. J., National Aerospace Lab., Netherlands; AGARD, Corrosion Detection and Management of Advanced Airframe Materials; Jan 1, 1995, 10 p; In English; See also 19950017076; Sponsored by Royal Netherlands Air Force; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

An evaluation of the eddy current technique for the detection and depth assessment of corrosion around fastener holes in F-16 lower wing skins is described. The corrosion type in this structure is pitting corrosion at the countersink edge of the fastener holes. Due to a corrosion clean-up limit of only 1.5 - 2.5 percent, a maximum thickness reduction in the range of 0.08 - 0.32 mm is allowed (depending on local skin thickness). This specifies the needed sensitivity for in-service corrosion inspection. In the evaluation use was made of specimens cut out of the F-16 lower wing skin structure. In total twelve specimens were exposed to an accelerated corrosion test (EXCO-test). Eddy current inspection of the specimens with installed fasteners was performed with a standard eddy scope and four different eddy current probes. After the eddy current inspection cross-sections of the twelve-specimens were made to determine the extent of pitting corrosion at the countersink edges. After evaluation of the inspection results the following conclusions can be drawn: for in-service detection of countersink edge corrosion standard visual inspection is the preferred technique regarding the simplicity, sensitivity and reliability of inspection; and for the purpose of depth assessment the eddy current technique is capable of detecting countersink edge corrosion with a depth from about 0.1 mm. Due to the corrosion clean-up limit of only 1.5 - 2.5 percent (0.08 - 0.32 mm), however, the eddy current technique is considered not applicable for in-service depth assessment of countersink edge corrosion in F-16 lower wing skins.

An overview is presented of several techniques under development at NASA Langley Research Center for detection and quantification of corrosion in aircraft structures. The techniques have been developed as part of the NASA Airframe Structural Integrity Program. The techniques focus on the detection of subsurface corrosion in thin laminated structures. Results are presented on specimens with both manufactured defects, for calibration of the techniques, and on specimens removed from aircraft.

A procedure of materials-science studies accompanying the process of product development, manufacture and service is offered. It provides correct selection of materials, trustworthy prediction of their behavior, high reliability of their operation in products of space-rocket application. Reliable prediction of material behavior during long-term service is achieved by breaking up the complex effect of the environment into individual factors and by analyzing the effect of each factor on the properties of the material.

Under the auspices of the AGARD Structures and Materials Panel R&D Cooperation Program, a round-robin NDI demonstration has been carried out. Six laboratories in four NATO countries participated in the project. The aim of the project was to determine the sensitivity and reliability of NDI procedures presently employed by the participating laboratories and to establish whether or not the procedures would be adequate for the implementation of a damage-tolerance based maintenance approach or whether improved methods are required.

The purpose of the present study is to perform a Bayesian reliability analysis for developing appropriate non-periodic inspection schedules and estimating values of uncertain parameters from data collected during in-service inspections for practical aircraft structural elements. Fuselage structures for an aging aircraft with a number of fatigue-critical elements, having potential to produce widespread damage, are used as a realistic structural model for the analysis. Each element consisting of a skin panel and frames, is subjected to cyclic stress and is designed with the damage tolerance criterion. Probabilistic factors considered in this analysis are fatigue crack initiation and propagation, crack detection capability and failure rates before and after crack initiation. Numerical simulations are performed to demonstrate the efficacy of the Bayesian reliability analysis for the development of inspection schedule and for the estimation of the unknown model parameters.

QUALITY ASSURANCE AND CERTIFICATION PROCEDURES FOR BONDED JOINTS IN ON-AIRCRAFT SCENARIOS

Maier, A., Daimler-Benz Aerospace A.G., Germany; Gunther, G.,

Daimler-Benz Aerospace A.G., Germany; Jan. 1997; 10p; In English; See also 19970019652; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

As the repair of primary composite aircraft structures using composite materials has become a matter of 'world wide interest and activity', the requirement of certification methods and engineering standards for composite repairs have become evident. Bonded joints for principal load transfer within the structure have to run through an extensive certification/qualification procedure during development phase and are subject to rigorous quality control during the original component manufacturing. However, within typical 'On-Aircraft' repair scenarios bonding procedures and manufacturing conditions are in almost every technical aspect different from original processes and require therefore more extensive verification. Methods to certify repair design, repair procedures, repair methodology and quality control depend on specific repair levels (i.e SRM, Engineering Disposition, ABDR) and are yet standardised. The paper describes DASA's current approach to certify bonded repairs for damages which require 'Engineering Disposition' for 'On-Aircraft' application.

This paper discusses currently available techniques for detecting damage in structures and their limitations. Inspection of cracks in substructure and hidden corrosion has always presented a nightmare for NDI engineers. Some recent advances made in the NDI technology to solve these problems are discussed. Proper inspection at regular intervals is one technology area which plays an important role in the safety of flight of military and commercial aircraft. Reliable visual and nondestructive inspection (NDI) methods are needed to assure the airworthiness of these aircraft and at the same time keep maintenance costs to a minimum.

AIRFRAME INSPECTION RELIABILITY

Sampath, S. G., Federal Aviation Administration, USA; Oct. 1996; 10p; In English; See also 19970041535; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Inspection reliability is a cornerstone of the damage tolerance philosophy underlying the U. S. Air Force Airframe Structural Integrity Program (ASIP) and their Engine Structural Integrity Program (ENSIP), which are designed to ensure continued airworthiness of its fleet. Inspection data are essential to deriving inspection thresholds and inspection intervals; elements of every maintenance program for the constituents within a fleet. Frequency and the method of inspection are primary drivers of maintenance costs and thus life-cycle costs. On the other hand, structural safety also depends on inspection reliability, i.e., the ability to detect damage in a timely fashion. This presentation highlights certain aspects of inspection reliability that primarily relate to airframe structures and recommends the establishment of an international data collection and cataloging activity for improving inspection reliability.

FRACTURE ANALYSIS OF STIFFENED PANELS UNDER BIAxIAL LOADING WITH WIDESPREAD CRACKING

Newman, J. C., Jr., NASA Langley Research Center, USA; Dawicke, D. S., Analytical Services and Materials, Inc., USA; Widespread Fatigue Damage in Military Aircraft; Dec. 1995; 16p; In English; See also 19960020736; No Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

An elastic-plastic finite-element analysis with a critical crack-tip-opening angle (CTOA) fracture criterion was used to model stable crack growth and fracture of 2024-T3 aluminum alloy (bare and clad) panels for several thicknesses. The panels had either single or multiple-site damage (MSD) cracks subjected to uniaxial or biaxial loading. Analyses were also conducted on cracked stiffened panels with single or MSD cracks. The critical CTOA value for each thickness was determined by matching the failure load on a middle-crack tension specimen. Comparisons were made between the critical angles determined from the finite-element analyses and those measured with photographic methods. Predicted load-against-crack extension and failure loads for panels under biaxial loading, panels with MSD cracks, and panels with various number of stiffeners were compared with test data, whenever possible. The predicted results agreed well with the test data even for large-scale plastic deformations. The analyses were also able to predict stable tearing behavior of a large lead crack in the presence of MSD cracks. The analyses were then used to study the influence of stiffeners on residual strength in the presence of widespread fatigue cracking. Small MSD cracks were found to greatly reduce the residual strength for large lead cracks even for stiffened panels.

A CONCEPT FOR THE EVALUATION OF MSD BASED ON PROBABILISTIC ASSUMPTIONS

Horst, Peter, Daimler-Benz Aerospace A.G., Germany; Schmidt, Hans-Juergen, Daimler-Benz Aerospace A.G., Germany; Widespread Fatigue Damage in Military Aircraft; Dec. 1995; 12p; In English; See also 19960020736; No Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

The present paper describes a general approach for the assessment of Multiple Site Damage (MSD), and as a subsequent phenomenon Widespread Fatigue Damage (WFD). A rough outline of the model used is presented. Furthermore, emphasis is put on the fact that a set of parameters will influence MSD as well as WFD, which all show a considerable probabilistic scatter. Some of those parameters are discussed in this paper; especially, the scatter of fatigue data. Manufacturing as well as deteriorating effects are discussed. Finally, an example indicates that the general line of the model works well.

No standard test practice currently exists for strain-controlled thermomechanical fatigue (TMF) testing. This paper discusses recent activities which lay the foundation for standardization of TMF test methods. Specifically, the paper documents the results of two interlaboratory TMF test programs, identifies key TMF symposia and workshops, and discusses efforts toward drafting a TMF standard test practice.

ELEVATED TEMPERATURE FATIGUE OF IN718: EFFECTS OF STRESS RATIO AND FREQUENCY

Branco, C. Moura, Instituto Superior Tecnico, Portugal; Byrne, J., Portsmouth Polytechnic, UK; Thermal Mechanical Fatigue of Aircraft Engine Materials; Mar. 1996; 12p; In English; See also 19960021124; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The paper presents a combined analysis of the influence of stress ratio, frequency (hold time) on the fatigue crack growth in IN718 at 600 C. Fatigue crack growth rate (FCGR) data is presented for three stress ratio values (0.05, 0.5 and 0.8) and several values of hold time at maximum load ranging from 10 to 600s. FCGR data is also presented for sustained load where oxidation damage and creep failure mechanisms dominate. A preliminary assessment is presented of the transition frequency behavior from transgranular dominant cracks to intergranular dominant. SEM observations show that specific types of failure can occur for different combinations of stress ratio and frequency.

Non-isothermal fatigue is one of the life limiting factors of the turbine blades in service. Thermal fatigue (TF) and thermomechanical (TMF) fatigue are two basic tests used for non-isothermal assessments of materials. In this investigation both TF and TMF tests are conducted. The mechanical strain at the wedge tip of blade-shaped TF specimens is measured as a function of temperature and applied as the basic TMF cycle. Crack initiation life and total life in TF and TMF are compared for CMSX-6. It is observed that the life under TF experiment is lower than TMF for the test conditions investigated. The effect of the thermal gradient fluctuation on the crack initiation life is reported for CM247LCDS. It is shown that a Miner's cumulative linear law can accommodate the effect of the variation of the thermal gradient on the remaining thermal fatigue life.

A thermal fatigue facility using a lamp furnace is described. This test is intended to simulate thermal shocks on a simple structure, and is shown to be a useful tool to investigate the damage evolution in

superalloys exposed to temperature transients up to 1100 C. This is illustrated by the study of two nickel-based superalloys: a wrought superalloy used for rocket engine, and a single-crystal superalloy (AM1) used for jet engine blades. The effect of the specimen geometry and of a coating on fatigue life and failure mechanisms are described. Comparisons with thermal-mechanical fatigue results show the necessity of thermal fatigue tests for studying high temperature materials. A heat transfer analysis and a stress analysis are made for two geometries of wedge type specimens. The temperature history of the thin edge as well as the stress-strain hysteresis loops are so computed. These computations are used for lifetime prediction. In the case of the wrought superalloy, TF experiments are found in good agreement with lifetime predictions and TMF test results.

Strain controlled thermo-mechanical fatigue cycles simulating the temperature-strain-time history at critical locations of blades of advanced aero gas turbines are applied to the single crystal nickel based alloy CMSX6 in the uncoated and PtAl coated conditions. The TMF cycle selection includes a 135 deg lag cycle and an in-phase cycle, with various R(sub epsilon)-ratios, T(sub min)=300 C, and T(sub max)=1050 C and 850 C, respectively. The cycle-specific stress response is analyzed and discussed in terms of the accumulation of inelastic strain during the TMF tests. The number of cycles for initiating microcracks is measured by means of a computer vision system. Various modes of crack initiation and crack growth are observed and correlated with the TMF cycle type, with the strain range imposed, and with the ductile/brittle behaviour of the coating. The differences in TMF lives are discussed in terms of the material and TMF parameters.

DEFORMATION AND FAILURE MECHANISMS OF DS CM 247 LC UNDER TMF AND LCF LOADING

Sommer, C., ABB Corporate Research Centre, Germany; Bayerlein, M., ABB Corporate Research Centre, Germany; Hartnagel, W., ABB Corporate Research Centre, Germany; Thermal Mechanical Fatigue of Aircraft Engine Materials; Mar. 1996; 12p; In English; See also 19960021124; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The deformation, crack initiation and crack propagation behavior of DS CM 247 LC in longitudinal and transverse orientation under LCF loading at 500 C to 1000 C and TMF loading (400-1000 C out-of-phase cycle) is described in this paper and discussed under the aspect of TMF life time prediction. Different deformation and damage mechanisms were found for low temperature LCF, high temperature LCF and TMF loading. The deformation and damage behavior under TMF loading incorporates characteristics typical for low temperature LCF as well as characteristics typical for high temperature LCF. Cutting of (gamma)' as well as interfacial network formation is observed. Cracks were found to initiate at strongly oxidized carbides similar to what is observed under high temperature LCF, the crack propagation however is a mixture of crystallographic and noncrystallographic crack growth. Cyclic plastic deformation at low temperatures (under low temperature LCF as well as under TMF loading) was found to be very detrimental. The coincidence between TMF life data and LCF life data at a temperature close to the upper temperature of the TMF cycle on a total strain

and equal strain rate basis maybe related to the oxidation controlled crack initiation mechanism which is identical for both types of loading or has to be regarded as fortuitous.

P., National Research Council of Canada, Canada; Thermal Mechanical Fatigue of Aircraft Engine Materials; Mar. 1996; 10p; In English; See also 19960021124; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Typical gas turbine and jet engine hot section components are subjected to severe environment along with variable thermal and mechanical loading histories. Furthermore, stress induced morphological transformations of the materials have been observed to occur during turbine engine operations with the amount of transformation a function of the thermal-mechanical history. At present, the popular models for thermal-mechanical fatigue (TMF) life predictions are based on creep-fatigue interactions and do not explicitly contain environmental and microstructural transformation features. In this paper, a novel framework and process simulation software, which explicitly tracks the evolution of the microstructure (including dislocations structures) is presented. In essence, this model described the overall behavior of a material as the weighted average of the mechanical responses of the present phases (or dislocation structures). Dynamic recovery is modeled by explicitly describing the transformations of a 'hard structures' to a 'soft structure' in agreement with the basics concepts of dislocations dynamics. The effectiveness of this novel multistructure approach will be demonstrated through modeling the TMF behavior of Rene 80.

The use of a linear damage summation approach for the prediction of crack growth rates under thermomechanical fatigue (TMF) is summarized. The methodology involves the addition of growth rates due to cyclic and time-dependent mechanisms. In creep-brittle materials, the summation approach is straightforward when applied to TMF. For creep-ductile materials, the retardation of the crack growth rate due to crack tip blunting, branching, or stress relaxation, has to be taken into account. This is accomplished through the use of a blunting coefficient with its own evolution equations. The methodology is applied to TMF crack growth in a titanium matrix composite by modifying the functional form of the two terms. The cycle-dependent term is taken as a function of temperature, while the time-dependent term has a slight Delta-K dependence coupled with the integral of an Arrhenius type term over an entire cycle. For all three materials, the modeling approach provides reasonable predictions of TMF crack growth rates based solely on parameters obtained from isothermal test data.

This article describes the study of uniaxial and biaxial thermomechanical fatigue (TMF) response of IN 738 LC and the initial experiments of single crystal superalloy SC 16. A life prediction assessment is proposed based on the inelastic work $\Sigma \sigma \Delta \epsilon$. It is shown that the J_2 -theory is applicable to TMF loadings. Initial experiments on single crystal superalloy SC 16 prove that there is a non-uniform strain distribution in the plastic region along the circumference of (001) oriented specimens. These findings must be weighed when performing TMF-tests.

Extreme temperature gradients and transients thermally induce the most severe cyclic stresses encountered by turbine airfoils. These thermal stresses combine with mechanically induced centrifugal and bending loads to produce thermomechanical fatigue (TMF) of the airfoil. Anisotropic material properties of advanced turbine blade alloys further complicate analysis and life prediction for these complex loading conditions. Designers and engineers require quick, efficient computational analysis to evaluate airfoil design iterations. A life prediction approach which can be utilized efficiently by designers needs to be relatively simple, but it must capture the first order TMF effects. This paper introduces a life prediction approach that utilizes 3D finite element output and applies a simplified constitutive model to predict the stress extremes of a TMF cycle in an advanced single crystal alloy. An appropriate TMF life relation, such as hysteretic energy, can be used to predict cyclic life.

Fundamental material behavior research in thermal mechanical cycling environments is obviously essential to eventual development and use of thermal mechanical fatigue (TMF) life models in component durability assessments. However, the scope of the research should be guided and focused by experience and issues encountered in actual product usage. Crack nucleation at surface intersecting ceramic inclusions and degraded low cycle fatigue (LCF) capability of thermally exposed shot peened surfaces are two elements of potential importance to more accurate TMF life prediction of powder metal (PM) nickel base superalloy turbine engine components. Both temperature dependent effects, identified and evaluated in a comprehensive alloy development program, provide significant challenge to conventional, applied engineering fatigue life prediction methodologies. But, nevertheless, such influences must be recognized in design, component manufacture, and field life management. An overview of observed material fatigue behavior provides an industry example as a basis to illustrate the importance, necessity, and benefit of a fully integrated (holistic) design, material processing, and component manufacturing system approach to obtaining desired product robustness.

Thermal mechanical tests with internally cooled model blades of IN 783 LC (conventional casted) and of IN 792 DS (directionally solidified) are experiments to develop non linear elastic analysis methods of stress strain behavior and life time estimation methods. For the inelastic analysis, a constitutive equation has been developed. This constitutive equation describes the deformation behavior by using internal variables which concern microstructural features. The constitutive equation has been implemented user materials routines (UMAT) in the finite element code ABAQUS. In the experiment with model blades, loaded periodically in simulating loading cycle of a real working blade for large stationary gas turbine, the temperature distribution are measured by a set of thermal couples around the blade and calculated with using heat transfer estimations for the impact of heat by a high frequency induction coil and heat consumption by the cooling air. Based on the calculated temperature distribution the stress strain behavior for different point was computed and as far as possible compared with measured strains. The comparison of experimental results with the mathematical prediction showed a fair conformity.

ACTIVE AND PASSIVE DAMPING TECHNIQUES

Tomlinson, G. R., Sheffield Univ., UK; Rongong, J., Sheffield Univ., UK; Smart Structures and Materials: Implications for Military Aircraft of New Generation; Oct. 1996; 6p; In English; See also 19970001697; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

The use of passive and active damping techniques for minimizing structural vibration is discussed. It is shown that passive damping, employing constrained viscoelastic layers requires careful consideration in terms of frequency and temperature in order to optimize the performance and that at high frequencies, the combination of longitudinal, flexural and radial modes can significantly modify the performance. When active methods are employed, dramatic improvements in the effective damping can be obtained and if this is combined with constrained viscoelastic materials, even greater improvements are found. This paper concludes with an overview of the concepts currently being applied and how Smart technologies should lead to effective solutions.

Methods of adapting the placement and properties of material within structures subject to static and dynamic loading are presented. It is shown that for a statically loaded cantilever a spatially local adaptation process can produce a structure which has a topology and material properties much improved from the original. For a dynamically excited structure an evolutionary method is used to add free-layer damping to the surface of the structure, reducing the amplitude of vibration while minimizing the mass of additional damping material.

In its most general form, the topology optimization problem of structures can be viewed as the process of identifying the characteristic (indicator) function of the domain occupied by the optimal structure. Such a topology design problem is an integer programming problem (material/no material), which is difficult to solve directly and may be ill-posed. One of the methods used to overcome these difficulties is to relax the problem by introducing a material volume fraction parameter that has a continuous variation from zero to one. In engineering applications, the relaxation is done introducing either a material model with microstructures, where the material properties are computed by the homogenization method, or via an artificial, generally a polynomial, dependence between the mechanical properties and the material volume fraction. Usually the obtained optimal (final) topology, which use the material distribution approach, does not characterize a well defined structure, i.e., it has regions with porous material and/or with checkerboard patterns. Also, it has been observed that the final topology is not stable with the finite element mesh refinement. The goal of the perimeter constraint is to overcome these problems. This work presents the development of a computational model for the topology optimization of a three dimensional linear elastic structure using the material distribution approach. The optimization criterion is the structural compliance, subjected to an isoperimetric constraint on volume and a constraint on the structural perimeter. The necessary conditions for optimum are derived analytically. These conditions are treated numerically through a suitable finite element discretization and solved by a first order method based on the optimization problem Augmented Lagrangian. The computational model developed is tested and analyzed in several numerical applications.

STRESS ANALYSIS OF OPEN AND FASTENER HOLE COMPOSITES BASED ON THREE-DIMENSIONAL SPLINE VARIATIONAL TECHNIQUE**

Iarve, Endel V., Dayton Univ. Research Inst., USA; Schaff, Jeffery R., Wright Lab., USA; Bolted/Bonded Joints in Polymeric Composites; Jan. 1997; 12p; In English; See also 19970019652 Contract(s)/Grant(s): F33615-95-D-5029; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

A three-dimensional stress analysis method has been developed and verified for open and fastener hole laminated composites. This method is based on independent spline approximation of displacement and interlaminar stress components. Spline approximation offers continuity of displacement, strain and stress fields within homogeneous domains, preserving at the same time the advantages of local approximation, such as sparsity of the resulting system of equations. Verification of the spline approximation solution for a fiber dominated 28 ply, IM7/5250-4, laminate with an open hole was performed through comparisons with experimentally obtained surface strain measurements using the moire interferometry technique. For the filled hole case, the contact problem describing the interaction between a composite plate with a circular hole and an elastic fastener has been solved with three-dimensional spline approximation of displacements and using the Lagrangian multiplier method. Direct comparisons are made with an asymptotic solution of the three body contact problem appearing at the elastic fastener hole edge in a composite laminate. Good agreement between the singular term of the asymptotic solution and spline variational solution for all stress components was observed.

in the open and filled hole tension problems. The power of singularity at a ± 45 ply interface in a $(\pm 45)_{(sub s)}$ AS4/3501-6 laminate with a filled hole was calculated for different stiffnesses of the fasteners.

DEVELOPMENT OF A STRESSING METHOD FOR BOLTED JOINTS**

Bauer, J., Daimler-Benz Aerospace A.G., Germany; Mennle, E., Daimler-Benz Aerospace A.G., Germany; Bolted/Bonded Joints in Polymeric Composites; Jan. 1997; 10p; In English; See also 19970019652; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper describes the various steps for the development of a stressing method for bolted joints in Polymeric Composites. First a semi-empirical analysis was generated correlating test results and the corresponding analytical data. Subsequently this predictive technique was used to derive carpet plots and diagrams which then form the basis for the stressing method. In order to cover arbitrary loading conditions the information from the diagrams is incorporated into an algorithm for final determination of the laminate strength.

A recent project at Imperial College was concerned with the development of finite element procedures for predicting the failure of bolted joints in composite laminates. Both 2-D and 3-D analyses were undertaken, one objective of the latter being to correlate the stress distributions around a fastener with the failure modes observed experimentally. In support of the FE work an extensive test programme was carried out on single fastener joints loaded at increasing fractions of the ultimate load. The nominally 2mm thick laminates were fabricated from prepreg which consisted of balanced satin weave fabric impregnated with epoxy resin. For each load level specimens were dissected and examined under an optical microscope. A 'map' of damage growth was obtained for specimen configurations exhibiting either bearing or net tensile failure. The principal failure modes observed were fibre microbuckling and through-thickness matrix shear cracking.

A new phenomenological modeling technique, called fatigue progressive damage modeling, was established. This new modeling technique is capable of predicting the residual strength, residual stiffness, and fatigue life of pin/bolt loaded composite laminates. Stress analysis, failure analysis, and material property degradation rules are the three major components of the model. A three-dimensional, nonlinear, finite element technique was used for the stress analysis. Based on the state of stress, different failure modes were detected by a set of failure criteria. To remove the requirement of a large experimental database for the failure analysis, a normalization technique

was adopted. By using this technique the restriction of the application of the failure criteria to limited states of stresses was overcome. Material properties of each element in the model were degraded by using sudden and gradual material property degradation rules. For this purpose an analytical model was established to predict the degradation of material properties of a unidirectional ply under multiaxial fatigue loading. Based on the model, a computer code was developed that simulates cycle by cycle behavior of composite laminates under fatigue loading. The modeling technique uses experimental data from a unidirectional ply under various types of uniaxial loading to predict the behavior of structures subjected to multiaxial fatigue loading. Fatigue testing of pin/bolt loaded composite laminates was performed to validate the modeling technique.

New analysis methods are developed for predicting the strength of bolted joints in fibrous composite laminates for geometries other than the standard test coupons, particularly in regard to in-plane-shear loads. The methods build on the author's earlier works, using the same technique of accounting for the stress-concentration relief permitted by the heterogeneous nature of fibre-polymer composites. Similar linear bearing/bypass curves, terminated by a bearing-stress cut-off, are predicted for these new joint geometries. The interactions have the same form as those which are now well accepted for the conventional case of parallel bearing and bypass loads, only with different slopes. The theory has been developed ahead of any relevant test data in the hope of encouraging an appropriate test program, so that these new solutions could be validated or refined and then added to existing joint-analysis computer codes with appropriate boundary conditions and failure criteria.

STRESS AND FAILURE ANALYSIS OF BONDED COMPOSITE-TO-METAL JOINTS**

Xiong, Y., National Research Council of Canada, Canada; Raizenne, D., National Research Council of Canada, Canada; Bolted/Bonded Joints in Polymeric Composites; Jan. 1997; 12p; In English; See also 19970019652; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The behavior of bonded composite-to-metal joints is examined based on the results of stress analysis and failure prediction using a quasi two-dimensional analytical model. Two joint configurations are considered which simulate the problems of bonded composite patch repair such as fatigue enhancement and crack patching. The metallic substrate is of uniform thickness, while the composite patch has a tapered region at its edges. Several typical failure modes associated with the adherends and adhesive are considered including substrate yielding, adhesive shearing, interface peeling, patch fiber breaking, patch ply shearing and patch ply peeling. The effects of the thermal residual stresses after curing on the load transfer between the adherends are discussed. Various geometric configurations are examined from an optimal design point of view.

The performance of carbon fiber/epoxy repair joints bonded with an epoxy film adhesive, under static and fatigue loading has been investigated. The joints have been immersed in water at 50°C for a period of 16 months and the effect of the hot/wet environment on the static and fatigue strengths was evaluated. In addition, residual strength tests, i.e. static tests of pre-fatigued repair joints were performed. The mechanical properties of the substrate and the adhesive forming the joint were also determined. Apart from the experimental study, it was also desirable to determine a failure criterion which will accurately predict the experimental strength of this joint. A parallel study on double lap joints prepared from the same substrate and adhesive as the repair joints, was performed. Static tests on lap joints of various overlap lengths were conducted. The experimental failure loads were used in conjunction with finite element analysis to examine the validity of proposed failure criteria.

NUMERICAL STRENGTH PREDICTIONS OF ADHESIVELY BONDED MULTIMATERIAL JOINTS

Laschet, G., Aachener Centrum fuer Erstarung unter Schwerelosigkeit e.V., Germany; Jan. 1997; 16p; In English; See also 19970019652; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Numerical tools have been developed in order to improve the strength prediction of adhesively bonded multimaterial joints. At first, a specific elastoplastic model based on the Raghava yield criterion is introduced for adhesives. Furthermore, in order to evaluate the strength reserve of a joint after local failure initiation, a simple smeared 2-D and 3-D crack propagation model is developed. Then, to improve this simple failure model, a new isotropic damage model for adhesives is presented, which is coupled with the specific elastoplastic one. Finally, the accuracy of this approach is illustrated by numerical strength and failure mode predictions of several single and double-lap joints.

The influence of service environment, bonding method and adherend properties on the fatigue resistance of adhesive bonded CFRP joints has been investigated. It was seen that environment had a significant effect on joint performance with hot/wet conditions proving extremely damaging. Composite lay-up also had a significant effect on the fatigue performance of joints and co-bonding was seen as an advantageous joining technique.

A study is hereafter described to investigate the structural behavior of cold bonded/bolted and simply cold bonded joints. These

joints are representative of connections at the interface of large diameter structures (over 4 m) in which sandwich composite panels have to be fixed to aluminium fork-shaped rings. They find practical application as adaptor structures for satellite launchers, providing high strength/stiffness performances, and are peculiar of areas fitted with continuous separation systems. Special low preload bolts have been introduced in order to avoid the use of through inserts in sandwich panels necessary to prevent the crushing of the core so optimizing mass and manufacturing cost/time but still maintaining very high load capabilities. A Finite Element analysis has been carried out to detect load distributions at the bolted/bonded interfaces of the joints. A test campaign is planned for the manufactured specimens and a final test correlation will be performed to compare experimental and theoretical results.

The conclusions of this report are that: detailed stress calculations methods for bonded and bolted joints require the input of accurate loads; the overall stiffness of honeycomb panels and bolted joints must be correctly represented in Fe models; and local non-linear effects should be considered in honeycomb panel ramps.

This paper deals with a problem of comparing two terrestrial images: the observed one obtained with a known device and the reference one that is an idealized picture of a given object. The whole problem is formulated in terms of statistical object identification. The SAR (Synthetic Aperture Radar) imagery main properties based on the analysis of experimental data are pointed out. A zonal SAR image model, signal fluctuation fluctuation statistics, number of looks, S/N ratio and natural cover fragmentation of terrestrial surfaces is proposed. Based on this model, the adaptive zonal recognition algorithms are built. Their efficiency has been confirmed experimentally in a wide range of zone contrasts and under various seasonal/weather conditions.

STRUCTURE, VARIABILITY, AND SENSING OF THE COASTAL ENVIRONMENT

Richter, Juergen H., Naval Command, Control and Ocean Surveillance Center, USA; AGARD, Propagation Assessment in Coastal Environments; Feb 1, 1995, 14 p; In English; See also 19960007226; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

Radar observations of coastal atmospheric structures and propagation data are presented to illustrate temporal and spatial variability of the propagation environment. Sensing of radio refractivity has historically been accomplished with direct sensing techniques such as

radiosondes. While direct sensing techniques provide good data for propagation assessment purposes, remotely sensed data would be more desirable. Various direct and remote sensing techniques and an assessment of their potential operational usefulness are reviewed. Included are radiosondes, refractometers, radar sounders, lidars, satellite-based sensors, and radiometric and radio propagation techniques. The need for and feasibility of providing three-dimensional, time-varying refractivity fields for propagation assessment are addressed. Aerosol extinction is often the atmospheric parameter limiting electrooptical systems performance. For proper performance assessment, slant path extinction must be known. For several decades, attempts have been made to infer aerosol extinction from lidar backscatter measurements. A discussion of selected lidar techniques and their limitations is presented.

We derive non-local boundary conditions (NLBC's) for use with PE (parabolic equation) methods to compute the coverage diagram of surface or airborne sensors. With these boundary conditions, the PE integration domain can be truncated in height, with large savings in execution times. One of our NLBC's can be applied even when the source is above the domain of interest: this provides an efficient tool for computing the coverage diagram of an airborne source. The truncated PE method has been validated against traditional PE techniques, and should provide a robust and fast way of predicting propagation effects in complex environments for both surface and airborne sensors.

In 1954 Cox and Munk used aerial photographs of sun glint to determine the statistical distribution of ocean capillary wave slopes as a function of wind velocity. When their equation connecting the slope distribution with sun glint is used on the horizon, however, an infinite glint is predicted even though it can easily be shown that sun glint should never exceed solar radiance. This paper derives an integral equation which connects the capillary wave slope distribution with ocean radiance. It predicts a finite sun glint on the ocean horizon and the proper value of sun glint in the calm sea limit. Away from the horizon an approximation reduces this integral to the algebraic equation used by Cox and Munk.

Remote sensing, either from satellites, airplanes, or remotely piloted vehicles (RPV's) can be used to obtain information from virtually all areas in the world. A wealth of information is relatively easily (and relatively cheaply) available from sensor systems in civil satellites, but this availability could decrease during times of increasing political tension. Cooperative programs must be encouraged to extract the required military information from unclassified civil sources. This symposium provides a platform for discussion between civil institutes, active in the area of remote sensing equipment, data handling, and processing on the one hand, and those who are involved in military applications on the other hand. The topics covered include: sensor systems; platforms; propagation effects; signal processing; military aspects; special civil applications; special techniques; and future developments.

The combined high resolution stereo-multispectral opto-electronic camera MOMS was flown on the Shuttle D2 mission in 1993 and will be operating for about two years in the framework of the Priroda/MIR mission to be launched in April 1996. Mission objectives, data evaluation, application examples including digital terrain model derivation are presented. Plans for a near term operational high resolution optical Earth observation system based on the MOMS development are discussed.

POSSIBILITIES AND LIMITS OF SAR INTERFEROMETRY

Rocca, Fabio, Politecnico di Milano, Italy; Prati, Claudio, Politecnico di Milano, Italy; Guarnieri, Andrea Monti, Politecnico di Milano, Italy; Remote Sensing: A Valuable Source of Information; Oct. 1996; 14p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

In this presentation we summarize the impact of interferometry on the design of synthetic aperture radar (SAR) surveys, its possibilities and limits. From the fringes a very good DEM is obtainable, with a vertical resolution that could be in the meter range or even less from airborne platforms. Millimetric motion of large areas of the terrain or of corner reflectors can be measured with good reliability and therefore the possibility of using the system to measure subsidence, landslides, coseismic motions has been demonstrated. The coherence of the interferometric pair is an important clue, that combined with the more usual backscatter amplitude, leads to high quality image segmentation. The wavenumber shift concept is finally introduced that may lead to a 3 dimensional view of the terrain. The same principle can be invoked to improve the resolution of objects that do not change with time.

Synthetic Aperture Radar (SAR) is today a valuable source of remote sensing information. SAR is a side-looking imaging radar and

operates from airborne and spaceborne platforms. Coverage, resolution, and image quality are strongly influenced by the platform. SAR processing can be performed on standard computers or dedicated hardware architectures, depending on required throughput and image quality. Besides imaging, SAR can perform other modes of operation and applications such as multi-frequency and polarimetric imaging, elevation mapping, and moving target identification (MTI). Current developments in SAR systems are concentrated on higher resolution and flexibility in performing advanced modes in the future.

SPOTLIGHT SYNTHETIC APERTURE RADAR: SYSTEM OVERVIEW AND APPLICATION TO THE MARITIME AND LAND ENVIRONMENTS

Damini, Anthony, Defence Research Establishment Ottawa, Canada; Haslam, George E., Defence Research Establishment Ottawa, Canada; Remote Sensing: A Valuable Source of Information; Oct. 1996; 10p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Spotlight Synthetic Aperture Radar (SSAR) is a research and development project to develop the technology to retrofit the AN/APS-506 search radar on Canada's CP-140 maritime patrol aircraft with synthetic aperture radar (SAR) imaging modes. Three SAR modes have been developed: strip map mode in which the antenna is pointed side-looking to the aircraft's desired track and continuous imaging of the terrain flown by is generated; range Doppler profiling (RDP) mode in which the antenna is pointed at an ocean going vessel and an animated image of the target is produced with time; and, spotlight mode in which the antenna is again trained on a target of interest and a single, high resolution image of the target is produced. Spotlight has two submodes: adaptive spotlight for ship imaging and non-adaptive spotlight for land imaging. The SSAR exploratory development model (XDM) was completed in 1990 and work since then has been oriented towards improving the system's performance and resolution, enhancing the signal processing routines and developing a real time airborne signal processor. An overview of the SSAR system is given. The original motive for the development of the SSAR was to aid in maritime surveillance. The SSAR system would produce at long range, a high resolution image of ocean going vessels from which the radar operator could discern vessel type. The land imaging capability and enhanced resolution of SSAR however, has created interest in its potential application to other areas such as arms verification and situational awareness.

The image chain engineering for a spaceborne synthetic aperture radar (SAR) requires the support of simulation tools and airborne demonstrators. In the future German/French spaceborne SAR program, several of these means are already used. Others are under development or under project. The main simulation tool in France is the SIROS simulator, specified and operated by CELAR in Rennes. In Germany, related tools are being developed by Dornier and DLR, i.e. SAR parameter synthesis and SAR performance analysis. Four airborne demonstrators are actually in operation. The airborne radar demonstrators are used to collect data in order to determine the characteristics of the clutter and of the targets and to identify all the physical phenomena related to the interactions between the electromagnetic wave and the targets in their environments. The future spaceborne radar will have image quality characteristics and detection capabilities

which will require the use of advanced techniques such as spotlight imaging, space time adaptive processing, and jammer cancellation. These techniques will be verified through a complete program of qualification and test requiring simulations and in flight demonstration.

This paper describes the development of simulation tools which include, among other things, a facility for the radar modeling of targets and their environments. These models use data derived from high resolution radar measurement equipment. The equipment, which is fully land mobile, enables the generation of high resolution polarimetric radar images of scenes at variable observation elevations in the 2-18 GHz range. Results from a measurement campaign carried out at the end of 1995 are presented.

D., Pennsylvania State Univ., USA; Balsiger, F., Pennsylvania State Univ., USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 10p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Active optical remote sensing techniques based on lidar have been mostly limited to ground based and aircraft applications because of rather restrictive I/R squared dependence of signal, low power efficiency (~1 percent) of flash lamp pumped lasers and large physical size required by the power system. The advances in diode pumped lasers and other electro-optical instruments make it possible to consider new possibilities. Opportunities for future aircraft, remotely piloted vehicles (RV) and satellite platform measurements over large spatial scales have prompted us to evaluate current capabilities for ground-based lidar measurements with a view toward future compact lidars. We have examined the Raman and Dial lidar techniques to determine their capability for various remote sensing applications. The Raman techniques, even with inherent sensitivity disadvantages of small scattering cross sections, have proven to be highly successful for ground-based remote sensing because they easily provide quantitative results, and these techniques will still be valuable from aircraft altitudes. Examples of ground-based lidar measurements of structure properties and minor species profiles have been used to provide confidence in the model calculations of expected performance from flight platforms. The use of acousto-optical tunable filters (AOTF) with lidar techniques provides special capabilities for measurement of Raman and fluorescent lidar returns. Applications of SPR-DIAL techniques for high altitude platforms would be useful for detection of chemical pollution in the atmosphere and waterways. Capabilities of current ground-based lidar systems for profiling meteorological properties, such as: density, temperature, water vapor, refractivity, chemical species, aerosol extinction, and particle characteristics, provide the base from which we may consider future applications. Our recent reports have

described the capability of lidars to measure species and temperature profiles. This paper focuses on the ability of lidar to measure and quantify aerosol properties.

The inversion of a radiative transfer model allows one to restore geophysical parameters starting with airborne radio metric data obtained on 6 February during the TOA-COARE experiment. These parameters are liquid precipitation, frozen precipitation, and cloud based vapor. Unfortunately, it is impossible to validate these results. However, the comparison with the precipitation rates obtained from these radar data shows that the major precipitation structures are suitably restored. An improvement of the radiative transfer model consists of introducing a layer of a mixture or a layer of melted ice, in order to take into account the presence of a bright band in stratiform location. The theories of Mie, Tmatrice, and of enclosed spheres are used to obtain vertical profiles of the diffusion and extinction coefficients in this part of the atmosphere. The variations of these coefficients in this zone are more important as the frequency is low and the snow density low. Therefore, it seems necessary to also take into consideration this mixed layer in the radiative transfer model.

AN OVERVIEW OF EOPACE (ELECTROOPTICAL PROPAGATION ASSESSMENT IN COASTAL ENVIRONMENTS), INCLUDING IN SITU AND REMOTE SENSING TECHNIQUES

Littfin, Kathleen M., Naval Command, Control and Ocean Surveillance Center, USA; Jensen, Douglas R., Naval Command, Control and Ocean Surveillance Center, USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 8p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The Electro-optical Propagation Assessment in Coastal Environments (EOPACE) is a five year multi-national effort to characterize electro-optical (EO) propagation in coastal environments. Existing EO performance codes incorporate models that were developed for open ocean conditions. These codes are not applicable to coastal environments where small surface craft and sea skimming missiles pose threats. Coastal environments may differ significantly from open ocean conditions, and need to be fully characterized. The objectives of EOPACE are threefold: (1) to investigate coastal aerosols by studying surf production, coastal air mass characteristics, and near ocean surface transmission characteristics; (2) to develop mesoscale and data assimilation models; and (3) to evaluate EO systems performance by studying targets and backgrounds, polarization techniques, performance of forward looking infrared (FLIR) and infrared search and track (IRST) systems, and tactical decision aids. During EOPACE, in situ and remote sensing techniques will be used to infer the impact of surf generated aerosol, air mass parameterization required for propagation codes, near ocean surface infrared transmission properties,

and IRST/FLIR systems performance in coastal environments. This paper gives an overview of the EOPACE effort and discusses the in situ and remote sensing techniques used.

A means to assess propagation conditions is to obtain sets of vertical refractivity profiles employing remote or in situ sensing methods, and to inject these profiles into propagation models from which we calculate propagation factor fields. Fundamental questions which are addressed in this effort are: (1) What errors are introduced when only a single measurement of refractivity profile is possible and the refractivity environment is assumed laterally homogeneous? (2) Where multiple profiles are capable of being measured, what errors are introduced for different profile spacings? Errors in the propagation factor field at 1 GHz, 3 GHz, and 10 GHz over broad areas of the lower troposphere are quantified in this paper as they relate to the above questions for two coastal regions; namely, the coastal regions of Wallops Island, Virginia, and San Nicolas Island, California.

19970006900 Rutherford Appleton Lab., Oxford, United Kingdom **MODELLING OF ROUGH SURFACE EFFECTS WITH THE MATCHED TRANSFORM PE**

Levy, M. F., Rutherford Appleton Lab., UK; Remote Sensing: A Valuable Source of Information; Oct. 1996; 6p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Generalized impedance boundary conditions allow the rigorous modeling of propagation over surfaces with angle-dependent reflection coefficients. We present a split-step parabolic equation (PE) implementation based on a matched transform approach. The method is applied to propagation over the rough sea in ducting conditions and to ground-wave calculations.

ON THE IMPORTANCE OF UTILIZING POLARIMETRIC INFORMATION IN RADAR IMAGING AND CLASSIFICATION

Krogager, E., Danish Defence Research Board, Denmark; Boerner, W. -M., Illinois Univ., USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 14p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Some basic polarization phenomenology and terminology, including the radar target scattering matrix, will be introduced. Significant advances of polarimetric radar over single polarization radar are pointed out by considering the response, i.e., the scattering matrix, for a set of significantly different elementary scatterers. The handling of polarimetric radar data requires special techniques. Examples of such techniques are explained, in particular the decomposition into physically relevant target constituents, and examples of actual applications to measured polarimetric synthetic aperture radar (SAR) data are demonstrated.

This paper describes the problems of modeling related to time limitations of the pulse emitted by a satellite-borne radar altimeter. A precise examination of the classical echo model and the properties of the altimeter signal allow one to show that the hypotheses required for traditional resolution are not verified. The specific results of the signal processing are then examined in order to explain the noise features of real echoes.

This paper deals with the characterization of natural targets in terms of backscattering properties using multifrequency multipolarization synthetic aperture radar (SAR) data acquired over the Campanian area (southern Italy) during the SIR-C/X-SAR shuttle mission of April 1994. The knowledge of the complete scattering matrix, usually measured in a linear basis (HV) allows the computation of a covariance matrix once a polarimetric characteristic vector has been defined. The scattering properties of natural targets, imaged by airborne and spaceborne SAR polarimeters, can be statistically described by such a matrix whose decomposition provides useful information about the nature of scattering mechanisms acting inside the resolution cell. If the polarimetric characteristic vector is defined using a set of simple matrices having a physical significance and if no correlation exists between the co-polarized and the cross-polarized channels, the covariance matrix assumes a very simple form and its decomposition provides a simple tool to get insight into the target scattering behavior.

AUTOADAPTIVE SCENE IDENTIFICATION IN MULTI-SPECTRAL SATELLITE DATA

Boekaerts, P., Vrije Univ., Belgium; Nyssen, E., Vrije Univ., Belgium; Cornelis, J., Vrije Univ., Belgium; Remote Sensing: A Valuable Source of Information; Oct. 1996; 8p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

A non-supervised scene identification scheme for multi-spectral satellite data is presented. The identification of a scene is equivalent to the assignment of meaningful labels to image regions belonging to the scene. Multi-spectral scene region detection is reduced to the problem of finding an algorithm that performs a data reduction on composite images while (optimally) preserving scene region information. A self-organizing one-dimensional feature map applied to random segments of individual METEOSAT channels has already been shown to meet the requirements of such an algorithm for mono-spectral cloud identification. The use of two- and three-dimensional feature maps cannot be generalized for bi- and tri-spectral scene analysis, but it is shown that conventional clustering algorithms can be used for that purpose. The latter is illustrated for tri-spectral scene analysis in METEOSAT composite images of the visible, infrared, and water vapor channels. A study of the segment size indicates that the small segment sizes are sufficient and even better than large segment sizes for multi-spectral scene detection. This is explained in terms of the distribution properties of the so called segment space and the structural features of the code vectors (code segments). Decreasing the number of code segments used to reduce the information content of METEOSAT composite images results in a systematic loss of scene information. The proposed method for multi-spectral scene identification can be applied to data sets obtained after the fusion of spectral information of different sensors with different resolution and opens interesting perspectives for automated object tracking in temporal sequences of satellite data.

MODELING AND WAVE-ORIENTED PROCESSING OF SCATTERING DATA FROM COMPLEX ENVIRONMENTS: LOCATION AND IDENTIFICATION OF BURIED OBJECTS BY GROUND PENETRATING RADAR

Felsen, Leopold B., Boston Univ., USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 10p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Inverse algorithms for processing data due to wave scattering from complex environments can be strengthened by incorporating relevant robust wave physics in the inversion scene. Discriminants (footprints) for object classification and identification are best documented in the configuration (space-time) spectrum (wave number-frequency) phase space. Illustrations here emphasize ground penetrating radar (GPR) applications. Because of the complexity of this target-background environment, the processing strategy generally relies heavily on numerical model based and statistical techniques. A model is proposed here which utilizes wave based analytic techniques to reduce the 'size' of the overall problem. The model is structured around high resolution pulsed-beam propagators for transporting the incident signal to and from the target through lossy dispersive soil environments. Attention is given to those portions of an overall problem which are good candidates for wave based analytic methods and those portions which are better served by other methods.

A GRADIENT BASED LINE DETECTOR

Lacroix, V., Ecole Royale Militaire, Belgium; Achery, M., Ecole Royale Militaire, Belgium; Remote Sensing: A Valuable Source of Information; Oct. 1996; 8p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

This paper describes a gradient-based line detector (GLD), a line detector filter. The operator makes use of the dot product of neigh-

boring gradient vectors. One pixel wide lines may be obtained after a line following algorithm started on local maxima of the GLD and continuing in the direction of the next maxima. The method presents several interesting aspects: it produces a clean output, it can cope with noise in the intensity, it detects lines of various widths, it may generate an output dependent on the line contrast, and finally, it provides an approximation of the local line width. Applying such a scheme for detecting roads on satellite images provides very good results.

A GLOBAL POSITIONING SYSTEM (GPS) TIDE GAUGE

Anderson, Kenneth D., Naval Command, Control and Ocean Surveillance Center, USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 6p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

A non-radiating, non-intrusive remote sensing method to measure changes in water height is examined. This tide gauge can be easily set up and be operating in a short amount of time. The amount of time is controlled by the time it takes to set up an antenna and acquire global positioning system (GPS) satellite signals. The equipment package can be small, about the size of two briefcases, and consists of a handheld GPS receiver, a small patch antenna, and a notebook computer. There is no requirement to install equipment in the water to measure the changes in water height. Even though modern tide gauges use non-intrusive height sensors, such as ultrasonic acoustic transducers that send a pulse toward the surface and measure the time delay between the transmission and reception of the pulse, accurate measurements always require the use of a stilling well and that must intrude into the water surface. While not amenable for all locations, the size, ease of installation and remote sensing aspects significantly reduce the logistics cost of a tide gauge. The US National Geodetic Survey (NGS) is interested in evaluating this tide gauge. Possible use is contemplated as a storm surge sensor during hurricanes and as a replacement for gauges installed in difficult areas. In addition, it is likely that the US Navy could use the means during amphibious operations, particularly in areas where the tidal effects are not well known.

AN ALGORITHM FOR SHIP TEMPERATURE RETRIEVAL FROM AIRBORNE INFRARED RADIOMETRIC MEASUREMENTS

Hughes, H. G., Science and Technology Corp., USA; Zeisse, C. R., Naval Command, Control and Ocean Surveillance Center, USA; McGrath, C. P., Naval Command, Control and Ocean Surveillance Center, USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 10p; In English; See also 19970006887
Contract(s)/Grant(s): N66001-94-0064; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

A remote sensing technique is described which enables the zero-range average temperature of a ship to be determined. The temperature is determined from airborne infrared radiometric measurements and vertical profiles of meteorological parameters with a modified version of the LOWTRAN7 computer code to remove the effects of the atmosphere and the sensor responsivity. Using long wave (LW) infrared ship signatures obtained with an airborne thermal imager (AGEMA 900) at different ranges, the algorithms ability to remove the effects of the atmosphere is examined. The sensitivity of the inferred zero-range temperatures to uncertainties in the ship's surface emissivity and the resulting effects on system performance predictions are discussed.

SOME RESULTS FROM AGARD STUDY AAS-42: POTENTIAL USE OF COMMERCIAL SATELLITE SYSTEMS FOR MILITARY APPLICATIONS

Dinguirard, Magdeleine, Centre d'Etudes et de Recherches, France; Wahl, Terje, Norwegian Defence Research Establishment, Norway; McDonald, James Murray, Office of Naval Research, USA; Carrin, Gerard, MATRA Marconi Space, France; Levy, David, Centre National d'Etudes Spatiales, France; Erich, Ull, Dornier Luftfahrt G.m.b.H., Germany; Zeller, Karl Heins, Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Briottet, Xavier, Centre d'Etudes et de Recherches, France; Remote Sensing: A Valuable Source of Information; Oct. 1996; 8p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The commercialization of space is rapidly making satellite communications, navigation, and remote sensing accessible to many users, both civilian and military. In 1994 it was decided that there was a need for an AGARD study of consequences to NATO of this new trend. A study covering satellite communications, satellite navigation, and satellite remote sensing, focused on both the possible NATO use and the threats of adversarial use of communications satellites against NATO was carried out. As part of this study, data on most known or planned non-military remote sensing satellites have been collected and analyzed, and some of the results of this analysis are reported here. Among the new elements that have been considered are commercial satellites with a resolution better than 10 meters, and near real time processing and delivery of synthetic aperture radar (SAR) images from radar satellites. It is clear that well-organized use of non-military remote sensing satellites among NATO countries can be a valuable supplement to current NATO surveillance data sources. Also, in certain kinds of crises or conflicts, fast access to commercial remote sensing images can have a high value for a potential NATO adversary.

This paper provides an overview of the resource management and surveillance requirements which led to the initial approval of the RADARSAT project, reviews the key elements of the operational system, and describes some of the capabilities that could assist the UN and NATO in promoting international peace and security. Recent research and ongoing trials aimed at demonstrating the ability of the RADARSAT system to satisfy the operational requirements associated with some of these peace and security applications are also addressed.

This paper describes a space map created in the civilian area because of the need for an available means of cartography that is up to date and inexpensive. This is comprised of a background image which is corrected within the geometry of traditional maps and enhanced by cartographic corrects. The space map was first modified in analog form and thus constituted one of the main promotion vectors

of the imagery acquired by the SPOT satellite. Their ground resolution, which heretofore is unequal (10 m) is perfectly suited to produce, in just a few weeks, coverage on the scales of 1:50,000 and 1:100,000 for large territories that have not been well mapped.

In recent years, radar imaging has gained more and more importance for military applications. In a side-looking synthetic aperture radar (SAR) configuration, the combination of Doppler processing and high range resolution via frequency agility provides a comparable resolution in cross range and range. In the first part of this paper, some fundamental issues like depth of focus, range migration, and speckle statistics are addressed and compared to results at the more commonly used longer wavelengths. The second part of the paper discusses several ways to use the polarimetric information within each pixel for the detection and discrimination of extended targets. A comparison is made between a polarimetric whitening filter, a selective Stokes vector averaging, and other methods that may help obtain a stable description of the polarimetric state of the signals to be processed subsequently. The main effort is aimed at discriminating extended man-made objects from a natural clutter background.

SYNOPTIC VARIABILITY REVEALED BY SATELLITE AND EQUIVALENT ALTITUDE

Greiman, Paul, Naval Air Warfare Center, USA; Rosenthal, Jay, Naval Air Warfare Center, USA; Helvey, Roger, Naval Air Warfare Center, USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 12p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Both real time assessments of electromagnetic (EM) propagation conditions (in the absence of direct measurements) and inferential techniques of forecasting duct occurrence, height, and intensity require the a priori knowledge of the relation between these duct parameters and the standard weather variables which describe large and mesoscale air mass features. Through pattern recognition of stratus/stratocumulus cloud features on meteorological satellite imagery, and by identification of air mass sectors and wind circulation, it is possible to estimate the present and future state of the radar propagation environment by first determining the spatial and temporal variability of inverse conditions, weather map features, and cloud features on weather satellite imagery.

REMOTE SENSING OF EVAPORATION DUCTS USING SHF PROPAGATION MEASUREMENTS

Rogers, L. Ted, Naval Command, Control and Ocean Surveillance Center, USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 10p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

A maximum likelihood method is implemented to determine the height of the evaporation duct from multifrequency, slightly beyond line-of-sight super high frequency (SHF) propagation measurements using data from the NATO sponsored propagation experiment in the vicinity of Lorient, France, during the fall of 1989. The model for the propagation environment is horizontally homogeneous with a vertical structure having two parameters, the evaporation duct height and the trapping layer base height. The environmental parameter space is discretized and propagation factors are computed using a parabolic equation model for each point in the parameter space. The relative likelihood of combinations of the environment parameters are computed from the mismatch of the vectors of modeled and measured propagation factors. Good agreement is found with evaporation duct heights calculated using bulk meteorological models.

EXPECTATIONS FROM EMET AND OESEE GROUND LISTENING OF POSSIBLE E.M. EVENTS GENERATED BY THE TSS 1R

Estes, Robert D., Harvard-Smithsonian Center for Astrophysics, USA; Sanmartin, Juan, Universidad Politecnica de Madrid, Spain; Tacconi, Giorgio, Genoa Univ., Italy; Remote Sensing: A Valuable Source of Information; Oct. 1996; 12p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

The Tethered Satellite System 1 Reflight (TSS 1R) program is a bilateral scientific agreement between NASA and the Italian Space Agency (ASI). The TSS 1R system consists of the shuttle Columbia which deploys, upward, by means of a 20 km long tether, a spherical satellite (1.5 m in diameter) containing scientific instrumentation. This system, orbiting at about 300 km from the Earth's surface, represents, presently, the largest experimental space structure. Due to its dimensions, flexibility, and conducting properties of the tether, the system interacts in a quite complex manner with the Earth's magnetic field and the ionospheric plasma, in such a way that the total system behaves as an electromagnetic radiating antenna as well as an electric power generator.

SCENE/OBJECT CLASSIFICATION AND SEGMENTATION USING MULTISPECTRAL DATA FUSION

Lazofson, L. E., Battelle Columbus Labs., USA; Kuzma, T. J., Battelle Columbus Labs., USA; Choe, H. C., Battelle Columbus Labs., USA; Preston, E. B., Battelle Columbus Labs., USA; Chovan, J. D., Battelle Columbus Labs., USA; Multi-Sensor Multi-Target Data Fusion, Tracking and Identification Techniques for Guidance and Control Applications; Oct. 1996, 175-184; In English; See also 19970012579; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Near-simultaneous, multispectral imagery of ground target and background signatures were collected over a full diurnal cycle in visible, infrared, and ultraviolet spectrally filtered wavebands using Battelle's portable sensor suite. The imagery data were coregistered and processed using a variety of classical statistical algorithms, artificial neural networks and data clustering techniques to classify pixels and objects in the imaged scenes. Imagery collected at different times throughout the day were employed to verify algorithm robustness with respect to temporal variations of spectral signatures. Sensor fusion hardware was also designed and built to accompany the sensor suite to provide real-time pixel classification capability. In addition, research is being performed to advance the state of the art using differential absorption lidar as an active remote sensing technique for spectrally detecting, identifying, and tracking hazardous emissions. These

investigations support a wide variety of multispectral signature discrimination applications, including automated target search and landing zone detection. Battelle's sensor suite has also been used to quantify the extent of natural gas leaks and record the thermal characteristics of smoke grenades.

NATO NAVAL EXERCISES AS OBSERVED FROM CIVILIAN RADAR SATELLITES

Wahl, Terje, Norwegian Defence Research Establishment, Norway; Skoelv, Age, Norwegian Defence Research Establishment, Norway; Jun. 1997; 4p; In English; See also 19970026418; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

Near real time use of the radar satellite ERS-1 has been demonstrated during several NATO naval exercises in Norwegian waters. In several cases low resolution SAR images have been satisfactory for detection of ships, while full resolution images have provided some additional information about the ships. Oceanographic features of interest for operation of acoustic sensors have also been observed. The steep incidence angle of ERS-1 is a very limiting factor for detection of smaller ships. The upcoming satellites RADARSAT and ENVISAT will improve on this.

The need for tactical reconnaissance satellites has been well assessed in the recent few years. Many concepts have been explored and proposed, mainly based on small satellites. The present technology permits the implementation of good performance instruments suitable to withstand with the limited resources of the small satellites. Alenia Spazio has been studying the architecture of constellation of small satellites both for civil and military applications since four years and the scope of this paper is to present the status of the projects. Despite the proposed satellite configuration is tailored on military requirement, the dual use of technology and resources is of paramount importance in a world where investments must be returned and optimized. This aspect with its implications shall be discussed in relation to the system architecture.

The U.S. Navy's Integrated Air Deployed Strike Surveillance (IADSS) initiative is a pathfinder effort in defining the next generation sensor and mission management systems for unmanned air vehicles (UAV). The sensor suite in development will be capable of deterministic to fully autonomous operations. This includes the capabilities for dissimilar sensor queuing, automatic sensor search and automatic target recognition. A key developmental item is the autonomous management system (AMS) that will "manage" the expanded onboard sensor suite. The envisioned equipment suite includes signal detection equipment, imagery systems and a duplex communication system. This paper is presented in three parts: an overview, the operational demonstrations and the supporting Science and Technology.

We have studied remote sensing data from sensors in different wavelength regions (optical, thermal infrared and microwave) and from different platforms (airborne and spaceborne) in order to extract geographical information. By comparing the extracted information with an existing geographical database of a test area in the Netherlands we find that to obtain military relevant cartographic information from remote sensing images resolutions of 5 meter or less are required. For appropriate classification of extended objects like agricultural fields multi-layer imagery is necessary.

The increasing number of high resolution image sensors in a near future, as well as the need for realistic 3D site databases for applications like simulation, terrestrial mission preparation and training, has emphasized the need for multi-sensor image-based system dedicated to the production and exploitation of 3D site model. We present here the design of such a system, including the required functionalities for this purpose. The system comprises a geometric reconstruction step, which aims at producing a geometrically reliable 3D model of the site, including the topography, from the aerial or satellite images available. Next step is the exploitation of other images, especially terrestrial photographs, for the mapping of real textures on the faces of the reconstructed objects, as well as the texturation of the terrain. The output of this stage is a realistic 3D site model that can be used by the exploitation module of the system, allowing the real time reconstruction of the scene from any point of view, interactively or according to a pre-defined scenario. This system has been prototyped by SYSECA and THOMSON TRAINING & SIMULATION (both subsidiaries of THOMSON-CSF) using their own software, and the results of an experimentation with real data have demonstrated the feasibility of our approach.

AIRBORNE DUAL SENSOR MILLIMETER WAVE-SIGNATURES OF MARITIME TARGETS AND SEA-CLUTTER

Makruschka, R., Forschungsinstitut fuer Hochfrequenzphysik, Germany; Essen, H., Forschungsinstitut fuer Hochfrequenzphysik, Germany; Apr. 1998; 7p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

In the framework of a NATO measurement campaign airborne signature measurements were conducted over sea with the dual frequency, polarimetric mm W Synthetic Aperture Radar MEMPHIS (Millimeterwave Experimental Multifrequency Polarimetric High Resolution Imaging System) with simultaneous operating front-ends at 35 GHz and 94 GHz onboard a cargo aircraft in side-looking configuration. Both front-ends are tied to the same system reference and are using the same IF pre-processing and radar waveform-generator. So as well a concise comparison between data at relevant mm W bands simultaneously, the two frequency bands, 35 GHz and 94 GHz, can be made. The performance data of the front-ends are summarized in a use of the data for multichannel/multifrequency SAR processing.

45 ENVIRONMENT POLLUTION

The paper describes the system configuration and the mm W-SAR processing algorithm and gives representative results for the generated radar images for ship targets, chaff and the sea clutter with emphasis on the multiparameter evaluation.

IR-SIGNATURES OF SHIPS: A CLASSIFICATION FEATURE WITHIN A SENSOR NETWORK

vomStein, H. D., Universitaet der Bundeswehr, Germany; Guenther, J., Universitaet der Bundeswehr, Germany; Haese, K., Universitaet der Bundeswehr, Germany; Apr. 1998; 10p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

A system is described by which on the basis of IR-signatures ships are classified using methods of varying interactivity. A sequence of images taken with an IR-camera in a sea environment is superimposed so that pixels in corresponding frames match as closely as possible. With this motion compensation and a following long-term filtering the signal-to-noise ratio is significantly improved. Subsequently the contour lines of the ship are extracted by a good signal-to-noise ratio this can be done automatically in other cases an interactive component is necessary. The contour of the 'unknown' ship is the feature for a correlative or a neuronal classifier. For both classifiers the reliability and the computing time is strongly dependent upon the size of the reference database. It is of inestimable benefit to include all the available sensor data (e.g. sonar and radar) in the classification process thus quickly and significantly reducing the initially very large search space.

The objective of the Perception Project is to study and develop methods that make it possible - on the basis of the observation of the environment by different detectors - to prepare and update a representation of the real world, suitable for facilitating the adoption of a decision. The project thus contributes to meeting, in a general fashion, the operational needs of monitoring, surveillance, information (intelligence), reconnaissance, be it in the setting of autonomous systems or systems for aiding in decision-making, whose overall function is within the context of a closed perception - decision - action loop.

NONLINEAR OPTICAL FREQUENCY CONVERSION MATERIALS FOR MULTI-BAND REMOTE SENSING AND SURVEILLANCE

Caracci, S., Wright Lab., USA; Femelius, N., Wright Lab., USA; Ohmer, M., Wright Lab., USA; Zelmon, D., Wright Lab., USA; Apr. 1998; 9p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

There exists many nonlinear frequency conversion materials today which provide access to wavelength bands not previously possible by other means (solid state, gas, or semiconductor lasers). of particular interest are optical sources for the 3-5 (micron) and the 8-12 (micron) wavelength bands. Operation in these optical transmission bands is very advantageous due to the large optical absorption of important chemical and biological materials and the low absorption of the atmosphere. A brief introduction of the uses of optical remote sensing and the unique properties of nonlinear materials for laser frequency conversion are described.

TREATMENT OF PLASTIC MEDIA WASTE

Foster, Terry, Esquimalt Defence Research Detachment, Canada; AGARD, Environmentally Safe and Effective Processes for Paint Removal; Apr 1, 1995, 1 p; In English; See also 19950025744; Copyright; Avail: CASI; A01, Hardcopy; A01, Microfiche

Although plastic media itself is not generally considered a hazardous waste, the paint particles containing chromate pigments contaminating the spent media are considered a hazardous waste product. There are currently four approaches under investigation aiming to reduce the volume of hazardous waste produced during paint stripping: elimination of the chromate containing pigments or other hazardous pigments from primers and coatings; separation of the paint or hazardous materials from the plastic or other media; encapsulation or recycling of the contaminated media to make it safe for disposal or reuse; and produce a biodegradable media. Research to develop new pigments and primers that will result in the elimination of hazardous pigments such as strontium chromate and in developing alternative anti-corrosive surface treatments to replace cadmium plating is continuing. Contamination of the spent media will remain a problem because the hazardous pigments and surface treatments will still be used on aircraft and their components for the foreseeable future. Therefore, the only realistic alternatives at the moment to reduce the volume of hazardous waste produced by PMB (plastic media blasting) are to recycle or re-use the media in some form or remove the hazardous materials from the media.

BIOREMEDIATION OF WHEAT STARCH MEDIA WASTE

Malavallon, Olivier, Aerospatiale, France; Oestreich, John, CAE Electronics Ltd., Canada; AGARD, Environmentally Safe and Effective Processes for Paint Removal; Apr 1, 1995, 2 p; In English; See also 19950025744; Copyright; Avail: CASI; A01, Hardcopy; A01, Microfiche

The development of a bioremediation process is designed to minimize most of the waste generated with dry media paint removal. The bioremediation method was developed by DOT Technologies in Canada. When paint is removed with wheat starch media, a dust waste is produced containing both starch and paint. The waste will also contain a percentage of inorganic materials from the starch, the paint waste and contaminants from the aircraft (sealants, tapes, ...). This disposal method first uses enzymes to render the starch component soluble in water, converting the starch to various sugars. Specially bred bacteria then digest the sugars, and some of the hydrocarbons in the paint. At this stage, the primary end products are carbon dioxide and water. This bioremediation method reduces the waste generated by dry paint removal by approximately 95 percent. The bacteria, bred by natural selection, tolerates high levels of heavy metals, and toxic hydrocarbons. The basic chemistry of bioremediation, as well as the management of bacteria in this application are summarized hereafter.

ENVIRONMENTAL IMPACTS FROM LAUNCHING CHEMICAL ROCKETS

McDonald, Allan J., Thiokol Corp., USA; Bennett, Robert R., Thiokol Corp., USA; AGARD, Environmental Aspects of Rocket and Gun Propulsion; Feb 1, 1995, 14 p; In English; See also 19960008937; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

Three independent studies have been conducted for assessing the impact of rocket launches on the earth's environment. These studies have addressed issues of acid rain in the troposphere, ozone depletion in the stratosphere toxicity of chemical rocket exhaust products and the potential impact on global warming from carbon dioxide emissions from rocket launches. Local, regional, and global impact assessments were examined and compared with both natural sources

and anthropogenic sources of known atmospheric pollutants with the following conclusions: (1) Neither solid nor liquid rocket launches have a significant impact on the earth's global environment and there is no real significant difference between the two; (2) Regional and local atmospheric are more significant than global impacts, but quickly return to normal background conditions within a few hours after launch; and (3) Vastly increased space launch activities equivalent to 50 U.S. Space Shuttles or 50 Russian Energia launches per year would not significantly impact these conclusions.

THE IMPACT OF SPACE ROCKET LAUNCHES ON THE EARTH OZONE LAYER

Tishin, Anatoli, Central Research Inst. of Machine Building, Russia; Alexandrov, Eric L., Nauchno-Proizvodstvennoe Obedinenie Typhoon, Russia; AGARD, Environmental Aspects of Rocket and Gun Propulsion; Feb 1, 1995, 9 p; In English; See also 19960008937; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

The paper addresses the problem of assessing the composition and quantity of substances exhausted by rockets during their trajectory flights. It demonstrates the necessity of taking into account chemically non-equilibrium processes taking place during exhaust gas flow through an engine nozzle, afterburning in the atmosphere and presence of the N₂ technological impurity contained in the liquid oxygen oxidizer in the amount of 0.5 percent N₂. Emission magnitudes of ozone-affecting substances by Energiya Shuttle, Zenit, Proton and MX rocket stratospheric flights are stated. It was noted that the estimated Energiya and Shuttle rocket major exhaust amounts differ from those stated in other works by one-two orders of magnitude. The stated assessment local impact on the stratospheric ozone shows that the Energiya launch effects are by an order of magnitude lower than those of the Shuttle. This fact is determined mainly by the influence of chlorine contained in ammonium perchlorate the latter being a solid fuel oxidizer. Due to that it would be reasonable to develop chlorine-free fuels or fuels with a low chlorine content. It is proposed to elaborate a procedure for calculating emissions of different substances by rockets, to publish atmospheric emission data on all the rockets in operation and to reach concord on this procedure with the leading organizations.

ESTABLISHING A SCIENCE-BASED ENVIRONMENTAL CLEANUP LEVEL FOR LIQUID PROPELLANT XM46

Caldwell, Daniel J., Army Medical Research Detachment, USA; AGARD, Environmental Aspects of Rocket and Gun Propulsion; Feb 1, 1995, 10 p; In English; See also 19960008937; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Liquid propellant XM46 is a developmental propellant that will be used with the regenerative injection gun in the Advanced Field Artillery System. Individuals may be accidentally exposed to XM46 during operational and maintenance procedures, and there may be residual contamination of soil or water after spills are cleaned up. XM46 is moderately toxic; the primary systematic effects are the production of methemoglobin, altered liver function, and enlargement of the spleen and liver. XM46 also produces skin irritation and is a strong eye irritant. Genotoxicity evaluations of XM46 were negative. XM46 was further evaluated to determine its potential to produce reproductive toxicity, such as alterations in paternal fertility, maternal pregnancy and lactation, dominant lethal effects, and growth and development of offspring. A teratology study was also undertaken to determine if XM46 causes birth defects in the developing fetus. No evidence of fetal toxicity related to XM46 exposure was noted in any of the dose groups; it was concluded that XM46 is not a reproductive toxicant or teratogen in the rat. Based on the results of these studies, a Reference Dose (RfD) was

established on which to base safe maximum contaminant levels for environmental exposures. Negotiations with the U.S. Environmental Protection Agency to adopt alternative risk assessment practices are underway in an attempt to establish a scientifically defensible cleanup level.

Creation and employment of rocket engines and ecological problems are known to be incompatible. Nevertheless, we must aspire to this ideal situation. All specialists recognize the effect of the combustion products of liquid- and solid- fuel rocket engines on the Earth in the local aspect. But, among the scientists, so far there is no generally-acceptable point of view as to whether or not the rocket engines affect the Earth's environment in the global aspect. The paper analyzes this problem, and presents a new unusual and unexpected point of view. Derived from text

CAEPE has been carrying out static tests of engines with solid propellant for many years. In order to authorize the square pulses of shooting, it has predictive means for modelling the impact of the shooting on the environment. Computer codes of simulation thus address the areas of acoustic harmful effects and those possibly prone to acid repercussions. These codes, which use the weather data obtained by radiosondes on the site, were gradually readjusted during tests of units of various tonnage (to strap-on booster P230 of ARIANE V). In the presentation, the emphasis was made on a model derived from the usual model of G.A. BRIGGS for the modeling of the rise of the effluents carried at high temperatures. The realism of simulations of formation of the acid rains passes indeed by taking into account this phenomenon. On the other aspects of the codes, the main references are provided.

ECO-CLIMATIC CLASSIFICATIONS BY USE OF NOAA-AVHRR DATA. A CASE STUDY: TUSCANY (CENTRAL ITALY)

Petkov, L., Centro di Studi per l'Applicazione dell'Informatica all'Agricoltura, Italy; Maselli, F., Consiglio Nazionale delle Ricerche, Italy; Conese, C., Consiglio Nazionale delle Ricerche, Italy; Tacconi, G., Consiglio Nazionale delle Ricerche, Italy; Remote Sensing: A Valuable Source of Information; Oct. 1996; 8p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Eco-climatic classifications have proven to be of great utility for the planning and management of various agricultural and forestry activities. Since usual methods are often expensive and not easy to apply, remote sensing data processing has recently been proposed to identify ecologically homogeneous land units NOAA advanced very high resolution radiometer (AVHRR) data in particular have been demonstrated to be suitable for this purpose thanks to their spatial resolution and frequency acquisition. While most works in this field have dealt only with normalized difference Vegetation Index (NDVI) imagery, it has been suggested that thermal and ancillary data could also provide significant information. These considerations have been kept in mind during the present study, which concerns the eco-climatic classification of a complex Italian region by the use of NOAA NDVI and thermal images from two years in addition to ancillary data. A complete methodology was developed for the processing of this integrated data set with particular reference to the identification of suitable numbers of main and sub classes. The results obtained testify to the eco-climatic value of the product obtained.

In Canada, the Federal, Provincial and Municipal governments have assumed responsibilities for different aspects of establishing and enforcing environmental legislation. As a partner in the largest aerospace company in Canada, Bombardier-Canadair uses various materials and processes which are regulated, such as organic coatings, resins, sealants, solvents, deoxidizers, chromic acid anodizing, cadmium plating, chromium plating, etc. The work done at Bombardier-Canadair over the last five years concentrated in eliminating ozone depleting compounds, reducing emissions of volatile organic compounds, reducing the amount of hexavalent chromium (Cr 6+) in our effluent, and replacing hazardous air pollutants. New issues are also being addressed, such as the replacement of methylene-based chemical strippers and the replacement of electrolytic cadmium plating. This purpose of this paper is to provide an overview of the various levels of environmental legislation facing Canadian Aerospace companies in general and Bombardier-Canadair in particular. The paper also summarizes the technical problems presented by such legislation and the work done by Bombardier-Canadair and Bombardier-de Havilland to solve these problems and achieve compliance. ENVIRONMENTALLY COMPLIANT SURFACE TREATMENT ACTIVITIES IN THE UNITED KINGDOM

Hitchen, C. J., Defence Research Agency, UK; Gostelow, C. R., Defence Research Agency, UK; Gostelow, J. C., Defence Research Agency, UK; Feb. 1997; 6p; In English; See also 19970023078; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

Environmental legislation is having a major impact on surface treatment activities in the UK (UK). This paper summarizes current UK legislation and aims to show, through a specific example of relevance to the UK Ministry of Defense (MOD) work undertaken to ensure that environmental compliance is achieved. This covers the introduction of paints, with reduced solvent levels, into the various branches of the Armed Forces, and general results and conclusions from the task are summarized. Paint removal issues are also discussed with regard to UK MOD operations. Two broader case studies are also presented to demonstrate that environmental compliance does not have to involve increased costs either at the manufacturing stage or during unnecessary 'pollution clean-up' activity.

Environmentally acceptable cleaning and surface pretreatment are being implemented in the US in order to reduce the costs of production and maintenance of weapon systems. The application of good business practices and decisions are central to meeting customer requirements, improving performance, reducing costs, environmental acceptability of materials and process and maintaining occupational health and safety. The key factors involved in any material or process change include, environmental acceptability, performance and affordability. The use of semi-aqueous and closed system volatile organic solvent cleaning has found widespread application within the US aerospace community. Metallic surface preparations including conversion coating, anodizing, adhesive bonding or electroplating are presently being converted the those not requiring the use of hazardous and toxic materials as well as large amounts of process water. Research and development activities are presently at a high level to develop new environmentally acceptable and safe processes for the long term.

Restrictions on use of products depleting the ozone layer, such as chlorofluorocarbons (CFC113) and T111, as well as other toxic substances, such as cadmium, volatile organic compounds (COV), and chromates, and gradual substitution by less dangerous toxic materials for the protection of the environment and health, are addressed. The cost factors associated with these changes are

discussed. Aerospatiale, in partnership with French aeronautical industries, instituted a strategically original approach to control the industrial risks generated by use of these materials.

US ENVIRONMENTAL TRENDS AND ISSUES AFFECTING AEROSPACE MANUFACTURING AND MAINTENANCE TECHNOLOGIES

Hartle, S. J., Naval Air Warfare Center, USA; Stephens, B. T. I., Naval Aviation Depot, USA; Feb. 1997; 12p; In English; See also 19970023078; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

The exploration, development and implementation of new aerospace maintenance and manufacturing technologies is partially driven by the increasingly strict environmental regulations and issues. In the USA, innovative technologies are competing for acceptance as the new generation aerospace materials or process standards. The selection of new manufacturing or maintenance processes is largely based on environmental acceptability, but increasingly centered on efficiency, rapid implementation, monetary payback, and most importantly on the ability of the technology to improve an aircraft's mission. In the near future, human health issues may dominate new technology projects funded through environmental programs as new studies show the possibility of the health risk of extremely small quantities of airborne toxics and particulate matter.

19960007228 Naval Command, Control and Ocean Surveillance Center, Ocean and Atmospheric Sciences Div., San Diego, CA, United States

TROPOSPHERIC REFRACTIVITY PROFILES INFERRED FROM LOW ELEVATION ANGLE MEASUREMENTS OF GLOBAL POSITIONING SYSTEM (GPS) SIGNALS

Anderson, Kenneth D., Naval Command, Control and Ocean Surveillance Center, USA; AGARD, Propagation Assessment in Coastal Environments; Feb 1, 1995, 7 p; In English; See also 19960007226; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Propagation assessment tools, such as the Engineer's Refractive Effects Prediction System, provide a near real-time capability to evaluate the performance of radar and communication systems and include tactical decision aids that can be used to mitigate or exploit atmospheric effects on propagation. However, a crucial factor for these analytical tools is a thorough knowledge of the spatial distribution of refractivity. Quantifying the refractivity structure is a different problem especially in the littoral zone where the sharp contrast between land and sea strongly contributes to both spatial and temporal variability. A technique to remotely sense the vertical refractivity profile of the lower atmosphere is examined. This technique infers the refractive structure from ground-based measurements of GPS satellite signals as the satellite rises or sets on the horizon. There are obvious advantages to this concept. Results from a series of satellite-to-ground signal measurements are presented and compared to 'ground truth' measurements made using radiosondes and an instrumented aircraft.

Marine atmospheric boundary layer (MABL) and ocean surface properties remotely sensed by airborne and ground-based sensors are compared with coastal in situ measured refractive conditions. Near-surface refractive conditions are influenced by near-surface turbulence (wind speeds), by surface temperature (SST), and by overlying air dryness. All the latter can be estimated within operational and research satellite data. Humidity and temperature gradients at the top of the boundary layer can be related to remotely sensed cloud properties and to ground-based infrared High Resolution Interferometer Sounder (HIS) measured profiles. Studies were performed in coastal (Norwegian, California) regions. In situ and ground-based remote data were obtained from ship mounted systems. Other remote data were from aircraft and from operational (NOAA, DMSP) and research (ERS-1) satellite borne sensors. In examined cases, remotely sensed information yields reasonable assessments of refractive conditions immediately above the surface but not of the structure at the top of the boundary layer. Remote data describe high resolution horizontal and temporal variations, important in the coastal, but not described by point measured in situ data.

Aerosol particle size distributions were measured during the MAPTIP (Marine Aerosol Properties and Thermal Imager Performance Trial) experiment at Hr.Ms. Tydeman. Extinction coefficients were calculated using a Mie routine. The analysis shows that the TNO local MPN aerosol model accurately predicts the aerosol extinction for data in its range of validity. The applicability of the MPN model decreases outside its limits for geographical region and environmental parameters. The model is compared to the Navy Aerosol Model. The chemical composition of the aerosol during MAPTIP is discussed in terms of geography and environmental parameters.

AEROSOL PROFILES NEAR THE SEA SURFACE DURING MAPTIP

Gathman, Stuart G., Naval Command, Control and Ocean Surveillance Center, USA; AGARD, Propagation Assessment in Coastal Environments; Feb 1, 1995, 11 p; In English; See also 19960007226; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

The Marine Aerosol Properties and Thermal Imager Performance (MAPTIP) experiment was designed to determine the profiles of the full size range of aerosol in the first 15 meters above the water surface under differing weather and wave conditions. Aerosol data taken during MAPTIP by NCCOSC RDT&E Div (NRaD) at the Meetpost Noordwijk (MPN) tower (52.2739 degrees N, 4.2961 degrees E) were used to determine the profile of aerosol during this period. The aerosol size distributions obtained from 1/2 hour averages were all converted to four aerosol extinction values for the wavelengths of 0.55, 1.06, 3.5 and 10.6 microns. The data obtained were shown to be from four different scenarios. First of all, during one period of very high relative humidity values, fog conditions were encountered which gave very

high extinction values. There were also times when the data were apparently contaminated by eddies from the tower which contained the exhaust from the power generator. However, most of the data came from two other regimes which could be easily separated in the data set. The times when the wind was from the north, the aerosol were more truly marine in nature. The rest of the time there was a strong continental component of the aerosol coming to the tower from the towns and factories to the east. This paper shows the profile of extinction from 12 meters to the water's surface for the oceanic type of aerosol as it is affected by the wind and other factors. Profiles of relative humidity from measurements and models are used to determine the extent to which extinction profiles would be modified by the growth of hygroscopic particles. A log curve is fitted to the open ocean data from MAPIP to describe the variation in extinction from shipboard levels to the tips of the surface waves.

AEROSOL MAPS MADE DURING MAPIP

Gathman, Stuart G., Naval Command, Control and Ocean Surveillance Center, USA; Jensen, Douglas R., Naval Command, Control and Ocean Surveillance Center, USA; AGARD, Propagation Assessment in Coastal Environments; Feb 1, 1995, 7 p; In English; See also 19960007226; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

In coastal areas, the simplifying assumptions of horizontal homogeneity used in open ocean analysis are not always useable. Various human-generated aerosol sources such as towns and industrial centers can provide a complex portrait of merging plumes of non-natural aerosols which are advected out to the littoral zones. The extensive meteorological and aerosol measurements made during the Marine Aerosol Properties and Thermal Imager Performance (MAPIP) experiment provided an ideal opportunity to view how these aerosols were advected from their sources to the littoral zone of the North Sea. MAPIP was conducted along the Dutch coast in October/November 1993. The NCCOSC, RDT&E DIV (NRAD) instrumented Navajo aircraft flew two star pattern flights a day during the experiment at altitudes below 500 feet. During these flights, aerosol size distribution measurements along the flight path were being continuously recorded. These measurements were utilized for making aerosol concentration maps of the various sized aerosol groups. This paper shows the mesoscale effects of aerosol advection making the marine boundary layer in a littoral zone much more complicated than that of an open ocean.

UMIST OBSERVATIONS OF ACCUMULATION MODE AEROSOL CONCENTRATIONS AND COMPOSITION DURING MAPIP

Smith, Michael H., Manchester Coll. of Science and Technology, UK; AGARD, Propagation Assessment in Coastal Environments; Feb 1, 1995, 8 p; In English; See also 19960007226; Sponsored by UK Defence Research Agency; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

The primary contribution of the UMIST Group to the MAPIP campaign consisted of measurements of the concentration and composition of the accumulation mode aerosol (0.05 less than r less than 0.1 microns). Direct measurements of soot carbon concentrations, by means of an aethalometer, demonstrated its ubiquitous presence throughout most of the trial. A thermal analytical technique was employed to determine the size-differential composition of the aerosol and confirmed that these soot carbon particles dominated the aerosol spectrum below about 0.1 microns in radius, with substantial particulate sulphate contributions for radii from 0.1 to 0.5 microns. The light winds and short fetches during most of the campaign meant that the sea

salt contribution to this small aerosol was generally slight. However, a brief period of northerly winds during the measurement period gave significant sea salt loadings for radii from 0.2 to 0.5 microns.

SURFACE LAYER TURBULENCE AND AEROSOL PROFILES DURING MAPIP

Davidson, K. L., Naval Postgraduate School, USA; Frederickson, P. A., Naval Postgraduate School, USA; Deleeuw, Gerrit, Organisatie voor Toegepast Natuurwetenschappelijk Onderzoek, Netherlands; AGARD, Propagation Assessment in Coastal Environments; Feb 1, 1995, 9 p; In English; See also 19960007226; Sponsored by NRAD Contract(s)/Grant(s): N00014-91-J-1948; NATO AC/243-6056; NATO AC/243-6092; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

The Naval Postgraduate School (NPS) and the TNO Physics and Electronics Laboratory (TNO-FEL) deployed in situ sensors near and on Meetpost Noordwijk (MPN) during MAPIP to describe the surface layer processes and also to evaluate models for near-surface aerosol profiles. Vertical profiles of aerosol counts were measured on the MPN tower by TNO-FEL with Rotorod impaction samplers. The aerosol distribution measurements were made for 10 radius bins, with centered radii ranging from 6.5 to 75 microns. Atmospheric surface-layer turbulence and stratification were measured by NPS from an instrumented buoy that was located a short distance from MPN. Existing models relate aerosol profiles to source, sink, and turbulent transport processes. The assumed source process is bursting air bubbles at the surface. The removal processes are turbulent deposition and gravitational fallout. Turbulent transport is described by the friction velocity and the near-surface stratification. The combined buoy and MPN data sets are shown to provide valuable descriptions of surface layer properties during the variable period from 26 October through 3 November. Results from eleven profile sampling periods were compared with model predictions for which buoy measured parameters and aerosol sizes were inputs. The predicted concentration often decreased more with height than observed. This is believed due to the coastal input to the aerosol source since advected aerosol would reduce influences on gradient of bubble production at the surface.

MULTISPECTRAL REMOTE SENSING OF THE COASTAL ATMOSPHERIC BOUNDARY LAYER

Wash, C. H., Naval Postgraduate School, USA; Davidson, K. L., Naval Postgraduate School, USA; Jordan, M. S., Naval Postgraduate School, USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 6p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Coastal marine atmospheric boundary layer (MABL) properties derived from satellite data are compared with coastal in situ aircraft and rawinsonde measured properties. A multispectral approach using visible and infrared (IR) data is tested to estimate indirectly important variables such as depth of the MABL. In situ data are obtained from aircraft, ship mounted systems, and from shoreline stations. In the examined cases, remotely sensed information yields reasonable assessments of the height of the top of the boundary layer as well as conditions immediately above the surface. Remote data describe high resolution horizontal/temporal variations, important in the coastal regions, but not described by point measured data. Limitations of the approach due to sun glint, continental aerosols and more complex MABL structures are discussed also.

NON-LINEAR PREDICTION OF IONOSPHERIC PARAMETERS IMPORTANT FOR FORECASTING THE BATTLESPACE ENVIRONMENT

Francis, N. M., Defence Evaluation Research Agency, UK; Brown, A. G., Defence Evaluation Research Agency, UK; Akram, A., Defence Evaluation Research Agency, UK; Cannon, P. S., Defence Evaluation Research Agency, UK; Broomhead, D. S., Manchester Coll. of Science and Technology, UK; Apr. 1998; 7p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Modelling results from a programme to improve the accuracy of the prediction of ionospheric parameters are presented. Ionospheric conditions impact upon communications, navigation/GPS, satellite operations and surveillance radar operations. As a result, ionospheric predictions have an important bearing upon the specification of the battlespace environment. The paper presents a novel and robust technique that can cope with the problems of noise and non-contiguity that are endemic to solar-terrestrial data sets. The method of using non-linear radial basis function (RBF) neural networks (NNs) to model the noon-day variation of the critical frequency of the F2 layer of the ionosphere, foF2, is investigated. A technique based upon singular value decomposition is also adopted for the purposes of noise reduction. The performance of the model is compared with the results obtained from the reference persistence model predictions. Consecutive noon-day foF2 values from 1957 to 1990 from the Slough ionosonde station (UK) are used to train and test the model. Predictions are made for timescales of one to thirty days ahead, using both the RBF and persistence models. Relative performance is quantified using root mean square error (RMSE) between the RBF and persistence prediction time series compared with the actual time series, over the testing interval. It is found that RBF NNs offer a significant improvement, approximately 60%, over the performance of the reference persistence model.

During the fall of 1993 a field experiment entitled Marine Aerosol Properties and Thermal Imager Performance Trial (MAPTIP) was conducted by NATO AC/243 Panel 04/RSG.8 and 04/RSG.5 in the Dutch coastal waters. The objectives of the trial were (1) to improve and validate vertical marine aerosol models by providing an extensive set of aerosol and meteorological measurements, within a coastal environment, at different altitudes and for a range of meteorological conditions; (2) to make aerosol and meteorological observations in the first 10 m of the ocean surface with a view to extending existing aerosol models to incorporate near-surface effects; and (3) to assess marine boundary layer effects on thermal imaging systems. Calibrated targets at different altitudes were observed to the maximum observable range under a wide variety of conditions in both the 3-5 and 8-12 micron bands. These data will be used for the development and validation ofIRST models and IR ship signature models with the view of deter-

mining the effects of marine-generated aerosols, turbulence, and meteorological profiles on their performance. Aerosol and meteorological instruments, as well as thermal imagers and calibrated targets, were utilized on the Dutch Meetpost Noordwijk (MPN) tower, at a Katwijk Beach Station, the Hr. Ms. Tydeman oceanographic vessel, on a Lynx helicopter, on a Dutch P3 Orion, on the NCCOSC RDT&E DIV (NRaD) airborne platform, and on buoy systems. This network of instrumentation has provided a comprehensive data base of aerosol size distribution profiles and relevant meteorological variables throughout the marine atmospheric boundary layer. Thermal imagery was included to provide ground truth for assessing the low-level propagation effects near the ocean surface. Measurements were made of atmospheric turbulence and refractivity effects in the IR and RF bands to assess the marine boundary layer effects on the degradation of thermal images. Calibrated targets at different altitudes were observed to the maximum observable range under a wide variety of conditions in both the 3-5 and 8-12 micron bands. These data are to be used for the development and validation ofIRST models and IR ship signature models for determining the effects of marine-generated aerosols, turbulence, and meteorological profiles on their performance.

A WEATHER FORECAST UTILITY MODEL FOR MILITARY MISSIONS

Bohlon, J. S., Aerospace Corp., USA; Reid, R. W., Aerospace Corp., USA; Oct. 1995; 18p; In English; See also 19960016897; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The weather FORecast Utility Model (FORUM) is being developed to analyze the benefit of forecast data to the operational commander in the field. To be relevant to a given operation, such a model must reflect the concept of operations (CONOPs) of the mission under study. Thus, the modeler must understand the operation's decision process, and, in particular, how weather data influences that process. Toward that end, the description of FORUM is illustrated by an air munitions mission, wherein both the go/no-no decision and a tactical payload alternative are decided on the basis of weather parameter predictions. Single target mission effectiveness is cast in the form of sorties used and days needed to complete the mission which, in this case, is ground target destruction. For multiple weapon/target site scenarios, effectiveness can also be expressed as targets killed within a fixed period of time or resources needed to negate a fixed number of targets. For multitarget scenarios, the force multiplicative effects of correct forecast data is manifested via such metrics. The weather parameter data being used to characterize forecast accuracy is the product of some very detailed analyses and simulation of the forecast process from satellite measurement through weather parameter prediction. The Forecast Systems Laboratory (FSL) of the U.S. National Oceanic and Atmospheric Administration (NOAA) is providing satellite measurement simulation and weather parameter prediction for a sample case within the continental USA. The statistical characterization of this data provides some of the input for the FORUM model.

SHORT-TERM PERSISTENCE OF LOW CLOUD FEATURES

Helvey, Roger A., Naval Air Warfare Center, USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 4p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A01, Hardcopy; A04, Microfiche

Considerable structure is present in low cloud features seen in weather satellite images of the region offshore southern California. From geostationary imagery, it is evident that translation of this structure is largely responsible for the variability in cloudiness experienced at any fixed point. This report describes the use of an interactive computer technique for tracking cloud features and to determine the

transport field. Statistics related to the persistence of cloud features are obtained to assess the possible value of extrapolation of preexisting patterns in forecasting conditions at any fixed point for a few hours.

INTERPRETATION OF PASSIVE MICROWAVE RADIANCES FOR
TACTICAL APPLICATIONS: CURRENT AND FUTURE CAPABILITIES
OF THE DEFENSE METEOROLOGICAL SATELLITE
PROGRAM (DMSP)**

Boucher, Donald J., Aerospace Corp., USA; Thomas, Bruce H., Aerospace Corp., USA; Holliday, Charles, Air Force Global Weather Central, USA; Jun. 1997; 12p; In English; See also 19970026418; Original contains color illustrations; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The DMSP program is the Department of Defense polar satellite system chartered to provide high quality meteorological data to strategic planners at major military command centers such as Air Force Global Weather Central in Omaha, Nebraska, as well as to tactical forces in the field. DMSP has a long history of flying state-of-the-art microwave instruments that derive vertical temperature and water vapor profiles, and detailed surface and near-surface properties such as soil moisture, and ocean surface wind speed. These microwave sensors complement the prime sensor, the Operational Linescan System (OLS). The OLS is a cross-track scanning cassegrain telescope that samples in the visible and infrared wavelengths, featuring near constant horizontal resolution across the scan. Advanced Very High Resolution Radiometer (AVHRR) channel 1 at 0.4-0.6 microns (1.1 Km resolution at nadir only). At the edge of scan, the AVHRR pixels become elongated, whereas the OLS remains nearly constant. The data from Figure 1 were taken at the Aerospace real-time groundstation with DMSP Flight 11 transiting at 1450Z on 26 April of 1995, and NOAA 12 at 1541Z on the same day. The coverage of these passes were virtually identical, but the difference in resolution between the two sensors is very apparent. The OLS has an additional capability of being able to image in the visible at night making use of reflected moonlight. Figure 2 is an example of the low light capability showing Japanese fishing fleets in the Pacific off the coast of Japan.

The planning and effectiveness of military operations can often be greatly enhanced by timely meteorological information. This information is particularly important during rapidly changing weather conditions and can be critical to the success of military operations in a dynamic tactical environment. Due to the ever increasing pace of modern high technology warfare, the revisit time of low orbit meteorological satellites is inadequate to provide the war fighter with timely weather data.

Advanced methods and means of controlled sea vehicle moving parameters and sea-way ones measurement are considered. Both directly measuring tasks and possibilities of control quality increasing of displacement and undisplacement ships and sea flying vehicles under conditions of active wave disturbances are analyzed. Design principles, some structural features and expected quality characteristics of device, being developed, for meter altitudes and distances measuring based on special phase radioaltimeter and inertial sensor integration are observed. When functioning in the sea-waves profile tracking mode, high measuring accuracy of sea-way and vehicle vertical moving parameters is provided. The mounting of several devices both on the left and on the right sides of vehicle allows to reconstruct the field of sea wave disturbances and to check roll and pitch parameters and draught or clearance as well. The conditions to be fulfilled for determining the main sea wave spread direction are investigated.

ELECTROMAGNETIC PROPERTIES OF SEA ICE

Jezek, Kenneth C., Ohio State Univ., USA; Remote Sensing: A Valuable Source of Information; Oct. 1996; 2p; In English; See also 19970006887; Copyright Waived; Avail: Issuing Activity; Abstract Only; Abstract Only

This paper reviews research completed by a team of investigators as part of an accelerated research initiative on the electromagnetic (EM) properties of sea ice. The objectives of the program are: to understand the mechanisms and processes that link the morphological physical and electromagnetic properties of sea ice; develop and verify predictive models for the interaction of visible, infrared, and microwave radiation with sea ice; develop and verify inverse scattering techniques applicable to problems involving the interaction of EM radiation with sea ice. Guiding principles for the activity have been first that all EM data are supplemented by careful

physical property data (salinity, density, roughness for example) and second, that broad spectral data be acquired in as near simultaneous a fashion as possible.

AEROSPACE MEDICINE

19950023206 Institute of Aviation Medicine, Oslo, Norway EFFECT OF HYPOXIA ON ARTERIAL BLOOD GASES IN SUBJECTS WITH LUNG DYSFUNCTION

Ryg, Morten, Institute of Aviation Medicine, Norway; Christensen, Carl C., Institute of Aviation Medicine, Norway; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 14 p; In English; Copyright; Avail: CASI; A03, Hardcopy; A02, Microfiche

Although air transportation is an efficient way of evacuating casualties out of combat zones, even the mild hypoxia in a pressure cabin may adversely affect the oxygen supply of subjects whose lung function is compromised. Obviously, the wounded are difficult to study systematically. It is, however, possible to evaluate pulmonary limitations of oxygen transport by investigating persons with various lung diseases. This paper presents the effects of very light physical work in hypoxia on subjects with chronic obstructive lung disease (COPD). These patients are characterized by obstruction of the airways, resulting in low expiratory air flow rates, and low maximal ventilation rates (Cotes 1993). We analyze the consequences of inadequate alveolar ventilation and increased resistance to diffusion in the lung for oxygen partial pressures in alveoli and arterial blood, and on arterial oxygen saturation. We also try to evaluate the usefulness of standard clinical tests in predicting susceptibility of lung patients to hypoxia.

The necessity of specialized nursing personnel for air evacuated patients in peace and war time led Medical Service of the Hellenic Air Force (HAF) to train officer nurses in the USA F.N. School in order to create a similar school in our country. This School was established in 1988 and the first FN's graduated the same year. At this moment, the training courses are for officers with a near future schedule for petty officers. The structure and performance of school conducted in accordance to US FN School in Brooks AFB San Antonio TEXAS, corresponded to the needs and abilities of our country. The ultimate purposes concerning the foundation of the school are: (1) to advance the quality of nursing care; (2) to install the minimum demands - standards of care for FN; (3) to access FN nursing enlightenment to all levels of medical personnel; (4) the readiness to respond in every emergency condition involving air evacuation demands in agreement with an appropriate program; (5) the attachment of education to all FN; and (6) to advance assurance quality with a predetermined procedure. Course is mandatory and operates on a theoretical base with a minimum of practical application. The experiences gained from FN during the involvement in three (3) scheduled air drills were fewer than expected. Flight nursing offers a unique and broad field to professional nursing with an opportunity to serve patients, community, integrating nursing as a basic part of aerospace medicine.

19950027631 Royal Air Force Inst. of Aviation Medicine, Farnborough, United Kingdom NEGATIVE TO POSITIVE GZ ACCELERATION TRANSITION Prior, A. R. J., Royal Air Force Inst. of Aviation Medicine, UK; AGARD,

Current Concepts on G-Protection Research and Development; May 1, 1995, 8 p; In English; See also 19950027629; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

Sustained negative Gz acceleration is an uncommon stress; it is poorly tolerated by the pilot, the airframe is normally stressed to only -3 Gz, and operationally there is no defined advantage for performing such a maneuver. However, during repeated pulls of high +Gz it is common practice to push negative Gz while regaining aircraft energy prior to another high G turn. During the period of negative G, which might be for only 1 or 2 seconds, there is the rapid development of bradycardia, peripheral vasodilation, and the likelihood of cardiac arrhythmias. In this physiological state the pilot then pulls positive G giving rise to profound changes in cerebral perfusion and a marked reduction in G tolerance. The use of anti-G trousers reduces the magnitude of this effect but there remains a significant lowering of G tolerance which, it is suggested, might contribute to the genesis of G-induced loss of consciousness.

This lecture summarizes practical experience and results of theoretical investigations in the field of anti-Gz protection of flyer in high performance fighter-aircraft. The physiological and ergonomical issues are examined of implementation in aerospace flying practice of the anti-G variable geometry seat, which is aimed at the prophylaxis of adverse effects of high sustained, rapid onset rate longitudinal (+Gz), lateral (Gy), and combined (Gz/Gy) accelerations. Presented are the results of estimation of protective efficiency for variable geometry seat, received at multiple centrifuge tests, as well as its advantages with reference to prolonged flights, which were discovered in ground flight simulator experiments. There are elucidated the main physiological particularities of effects of lateral Gy and combined (Gz/Gy) aerial combat maneuvering accelerations. The applicability of variable geometry reclining seat is verified for prevention of some deleterious effects of hypergravitation of flyer's organism. Significant role is shared to physiologo-hygienic aspects of flyer's articulate seat in context with arrangement scheme for flight cabin workstation in high performance fighter aircraft.

19950027636 Department of the Air Force, Brooks AFB, TX, United States NEW ADVANCES IN PHYSIOLOGICAL MEASUREMENTS DURING HIGH-G: TECHNOLOGY

Baldin, Ulf I., Department of the Air Force, USA; AGARD, Current Concepts on G-Protection Research and Development; May 1, 1995, 10 p; In English; See also 19950027629; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

New noninvasive techniques for measuring cardiovascular parameters have been introduced to the acceleration research in centrifuge and in flight in fighter aircraft. Transcranial Doppler blood flow velocity measurements have been used in the centrifuge to detect brain blood flow changes during high G. As probe movements during high G is a problem, a remote control probe system has been developed and tested for better accuracy. Infrared spectrophotometry has been tested during increased G, but further development is required. Ear opacity blood volume measurements of circulatory endpoints during high G has been re-introduced. The use of Finapres or similar equipment to measure finger blood pressure has shown to be a very effective tool in acceleration research, both in the centrifuge and in flight, when used properly. Impedance plethysmography has also shown to be a useful tool in acceleration research. Doppler ultrasound

blood flow measurements and echocardiography are difficult to use at high G-level, if new robotic techniques are not developed. Subjective scales for ratings of perceived exertion during testing of G-protecting measures or during centrifuge fatigue studies seem to be valuable tools in acceleration research and may help to avoid the need for maximal tests in the centrifuge and thereby discomfort and injuries.

The often-used subjective measurements of +Gz tolerance are inadequate because they are prone to subjective bias and cannot document the time-dependent changes in the reacting physiology. This lecture describes noninvasive, objective measurements used to measure the human subject's physiological status, to monitor physiological reactions in order to compare the +Gz protective value of various +Gz countermeasures, and to measure endpoints which will guide the termination of +Gz exposure.

During the past several years considerable effort has been put into the development of computational techniques for handling the scattering and diffraction of electromagnetic waves by an object. We can distinguish between global techniques (e.g., the use of wave function expansion and integral equation) and local techniques (finite-difference and finite-elements methods). In this paper we present a global technique to solve the full three-dimensional scattering problem by strongly inhomogeneous objects. This domain-integral is formulated in the frequency-domain. The strong form is weakened by using appropriate test functions and expansion functions. Subsequently, the domain-integral equation obtained is then solved using an iterative Conjugate Gradient scheme combined with an efficient computation of the convolutional integral involved by using the Fast Fourier Transform algorithm (WCG-FFT method). In order to show the accuracy of the method with the scattering problem by an inhomogeneous dielectric sphere with the Mie-series solution. Then, numerical computations are carried out on a MRI-scan generated model of a human body inside a metallic enclosure with apertures. Here, we present the absorbed power density inside the human body.

REACTION TIME AND THE EEG UNDER HYPERVENTILATION

Freund, Wolfgang, Institute of Aviation Medicine, Germany; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 24-1 - 24-8; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

EEG recordings at rest and during controlled hyperventilation (HV) with simultaneous recording of reaction time measurements taken from 59 pilots and candidates in the German Air Force Institute of Aviation Medicine (GEAF IAM) are used to investigate: the correlation of visible EEG changes during HV and changes of cognitive functions; and the feasibility of two different methods of measuring the CO₂ (infrared absorption gas analyzer vs. solid body ceramic transdermal electrode) during this experiment. Under HV the CO₂ decreases from a median of 37 at rest to 22mm Hg during HV. The amplitude of the EEG activity increases as the main frequency decreases. No paroxysmal activity is recorded. Reaction time increases markedly under HV (from 184ms to 226ms). Surprisingly, no correlation shows between EEG changes and reaction time. Both methods of CO₂ measurement prove their feasibility, while the gas analyzer is faster and easier to operate. The implications of these findings are discussed.

Perception of angular & linear acceleration provides together with vision the fundamental cues for situational awareness in aviation environment. Therefore, the function of the otoliths & the semicircular canals as the end-organ of balance and their perception limitations play an important role in a flight environment employing mainly high performance aircraft. This paper addresses the need to identify & provide the physiological basis for the vestibular limitations of motion perception which accounts for several disorientation illusions. Under this view, certain areas of flight configuration envelope known as precipitators of illusions are outlined and the consequent most common vestibular illusions are attributed to their physiological basis. Vestibular behavior continuum is also outlined both in a non-Ig environment and in Motion Sickness. The danger upon flight safety imposed by the vestibular function limitations can be alleviated by proper training, selection & numerous technology aids integrated in modern cockpits.

These proceedings include the Technical Evaluation Report, three Keynote Addresses, 33 solicited papers and four special session papers of the Symposium sponsored by the AGARD Aerospace Medical Panel and held at the Deutsche Forschungsinstitut für Luft- und Raumfahrt, Linder Höhe, Cologne, GE from 9-12 October 1995. NATO air operations in the future will have improved capabilities for mobility, flexibility, rapid augmentation and situation awareness. The rapid changes and sophisticated innovations taking place in technology imply that air warfare will become more knowledge intensive and, accordingly, more dependent on a well conditioned nervous system. Advancements in technology are also driving air and the concomitant support operations into the outer limits of human mental and physical endurance. There is also the requirement of doing more work with fewer resources. The purpose of this Symposium was to address some of the factors that impose limitations on the nervous system, and to consider the practical challenges for enhancing neuro-

logical performance in such operational conditions as described above. The papers addressed neurological limitations imposed by: (1) the Gz environment; (2) the hypoxia environment; (3) disease and trauma; (4) neurosensory limitations; (5) fatigue and sleepiness in workload; (6) stress effects; and (7) sustained operations. The practical challenges in enhancing neurological performance were addressed for: (1) heavy jet operations; (2) rotary wing operations; (3) air traffic control operations; and (4) ground and support operations. These proceedings will be of interest to those concerned with the health and safety of personnel in air and support operations, and the aerospace scientist wanting a review of relevant research in the field of air operations neuroscience.

NEUROLOGICAL INFLUENCE IN PUSH-PULL EFFECT

Banks, R. D., Defence and Civil Inst. of Environmental Medicine, Canada; Goodman, Len S., Defence and Civil Inst. of Environmental Medicine, Canada; Apr. 1996; 10p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

During straight and level flight, aircraft occupants are exposed to the normal acceleration force of gravity, that is +1 Gz. Evolutionary development of homeostatic control of blood pressure (BP) via neurological and cardiovascular mechanisms occurred under the continuing influence of +1 Gz during walking or sitting. Thus, humans have not yet evolved mechanisms to compensate for significant excursions from +1 Gz. Aircraft occupants are frequently exposed to short duration accelerations other than +1 Gz. Air turbulence, for example, exposes occupants to short (up to 0.5s) exposures to Gz. Coordinated banked turns in jet aircraft expose occupants to sustained increases in +Gz. Nose-down, or 'bunt' maneuvers expose occupants to relative -Gz (that is, Gz that is less than +1 Gz). Understanding of the effects of exposures to variations in Gz is incomplete. Because sustained increases in +Gz occur commonly in flight and can be studied in laboratories with the use of human centrifuges, much work has been accomplished. However, research conducted on human centrifuges commonly suffers from the bias of a starting baseline of +1.4 Gz, a condition that seldom exists in actual flight. Much less is known of the effects of increased +Gz when the starting condition is less than +1.4 Gz. The few studies that report on Gtolerance when +Gz baseline varies are preliminary, but have demonstrated that tolerance to +Gz decreases more when preceding Gz is relatively more negative. This effect, termed the 'push-pull effect', increases with increased time of exposure to preceding relative -Gz. In-flight studies have shown that a proper anti-g straining maneuver (AGSM) and/or g-suit inflation only partially counters push-pull effect. The recent fatal crash of a Canadian Forces CF-18 due to push-pull effect has highlighted the inadequacies of current protection strategies. Prevention of similar accidents requires completing our understanding of acceleration physiology. As a rationale for future research efforts aimed at achieving this understanding, this paper discusses the possible neuro-cardiovascular processes involved in pushpull effect.

SEIZURE ASSOCIATED WITH G-LOC: A POTENTIALLY FATAL OCCURRENCE

Gray, G. W., Defence and Civil Inst. of Environmental Medicine, Canada; Paul, M. A., Defence and Civil Inst. of Environmental Medicine, Canada; Neurological Limitations of Aircraft Operations: Human Performance Implications; Apr. 1996; 4p; In English; See also 19960053795; No Copyright; Avail: CASI; A01, Hardcopy; A03, Microfiche

G-induced loss of consciousness (G-LOC) is a potential aeromedical catastrophe. Some pilots live to tell the tale, but over the last 15 years with the deployment of aircraft capable of rapid-onset high sustained +Gz there have been an increasing number of fatal fighter jet accidents which have been attributed to G-LOC. Recognition of unheralded G-LOC with rapid onset/high sustained G as a cause of

aircraft accidents has led to G-training programs in many NATO Air Forces which have been successful in reducing but not eliminating the occurrence of G-LOC accidents. Whether or not a pilot recovers from a G-LOC episode in time to effect a recovery depends on a number of factors; situational including aircraft altitude and attitude when G-LOC occurs, and physiologic - the duration of G-LOC and time to recovery of neural function sufficient to allow recovery of control or ejection. The time to functional recovery following G-LOC has been studied by a number of investigators. Forster and Cammarota found centrifuge subjects who experienced GLOC had incapacitation times averaging about 12 seconds, from G-LOC to recovery sufficient to deactivate warning signals in the centrifuge. Recovery time for more complex behaviour including simulated trimming of aircraft power and acquisition of a target was longer, about 60 seconds. In a later study, Forster, Cammarota and Whinnery found incapacitation times of 15-20 seconds in aircrew participating in a G-training program who experienced G-LOC. Incapacitation times varied somewhat depending on the type of G-exposure (gradual onset or rapid onset). It was found that performance as measured by choice reaction times and arithmetic computation tasks was degraded during the first minute of recovery from G-LOC and progressively improved over the next 2-3 minutes. Although these studies provide information on the time to recovery of consciousness, there have been no studies which have monitored the ability of subjects to integrate the complex behaviour required to fly an aircraft following G-LOC. At DCIEM, Michel Paul has undertaken a study to measure subjects' ability to fly an aircraft simulator through a standard approach and landing immediately following an episode of G-LOC.

CERVICAL SPINAL CORD INJURY TOLERANCE UNDER +GZ ACCELERATION

Mazuchowski, E. L., II, Pennsylvania Univ., USA; Whitley, P. E., Hahnemann Medical Coll. and Hospital, USA; Thibault, L. E., Hahnemann Medical Coll. and Hospital, USA; Apr. 1996; 6p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Experimental manikin ejection data from the U. S. Naval Air Warfare Center was analyzed using a multimodality biomechanical approach to investigate the consequences that helmet mounted devices and improper head positioning have on the cervical spinal cord during ejection from high performance aircraft. Accelerations of the head center of gravity from the manikin studies were compared to a physical model of the head-neck complex run under similar conditions. Strain and strain rates in the cervical spinal cord obtained from this biofidelic physical model were compared to the functional tolerances of isolated myelinated axons, crustacean spinal cords, and isolated neurons. If the strain and strain rate exceed the isolated tissue and cell culture critical threshold levels (greater than 15% and 1s(exp -1), respectively), altered calcium homeostasis and electrophysiological dysfunction occur. Results suggest that moving the combined head-helmet center of gravity forward and positioning of the head improperly during ejection increase the possibility of neurological deficit and that the cervical spinal cord must be considered in evaluating the feasibility of egress procedures.

THE USE OF FINITE ELEMENT MODELING TO EVALUATE DISEASED SPINAL COLUMNS FOR AIRCRAFT EJECTION SAFETY

Drew, William E., Armstrong Lab., USA; Apr. 1996; 4p; In English; See also 19960053795; No Copyright; Avail: CASI; A01, Hardcopy; A03, Microfiche

A great deal of work has been accomplished analyzing ejection seat acceleration profiles and their effects on normal, non-diseased spinal columns in aviators. Considerably less work has been accom-

plished on the effects of aircraft ejection on diseased spines, which are, in fact, quite common in the flying community. This study was an attempt to address this concern and specifically to evaluate a particular mathematical model for accuracy in predicting whether specific spinal diseases or geometries will enable safe aircraft ejection without further spinal injury. Pilots ejecting from early aircraft ejection-seat systems had approximately a 12% incidence of vertebral fractures. The newer ejection systems have a lower maximum acceleration force in the Gz+ direction and also a considerably slower G onset and are generally safe for the typical pilot (adult male) without spinal disease when the pilot ejects within the envelope (altitude, speed and attitude limitations). But if a surgical procedure is done on the spine, e.g., a laminectomy, hemilaminectomy or cervical fusion, there may be a decrease in the overall strength of the spinal column, leading to a fracture or dislocation of vertebrae, disk herniation, or even spinal cord injury during ejection. Extensive previous work, including animal modeling and mathematical modeling, much of which has been performed by the Crew Systems Directorate at Wright-Patterson AFB, addresses this issue for the nondiseased spine. When a pilot ejects from an aircraft in a typical ejection seat, his vertebral longitudinal axis is approximately in line with the rails on the back of the seat, which is the direction of thrust (Figure 1). Therefore, the direction of forces is essentially in line with the vertebral axis. Also, because the adult spine has a kyphotic and lordotic curvature, there are force vectors other than perpendicular in relation to the vertebrae.

HYPOXIA INDUCED IMPAIRMENT OF GRANULOCYTE FUNCTION

Neslein, I. L., Royal Norwegian Air Force, Norway; Myhre, K., Royal Norwegian Air Force, Norway; Bjerknes, R., Royal Norwegian Air Force, Norway; Apr. 1996; 10p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Adequate resistance to infections depend upon, among other factors, the phagocytic capacity of polymorphonuclear neutrophilic granulocytes (PMNL). It is well documented that hypoxia stimulates the formation of red blood cells. But this study, together with some early works, indicate that hypoxia might stimulate the hematopoietic system in general, not only the erythropoietic cell lines. Hypoxia may interfere with ATP-dependent cell function. Intermittent or chronic exposure to hypoxia could therefore adversely affect resistance to infections. Rats were exposed to repeated hypobaric hypoxia (0.5 atm) for 17 hours per day for 0-7 days. This induced a significant reduction of the phagocytic capacity of the neutrophil granulocytes in addition to an increase in hematocrit, haemoglobin, thrombocyte, and total leukocyte concentrations. Differential counting of peripheral blood cells revealed significant granulocytosis, whereas the fraction of circulating lymphocytes was decreased. Microscopic examination and cell cycle analyses of rat bone marrow revealed stimulated hematopoiesis. An increase in the plasma concentration of corticosterone was observed in the middle of the experimental period, but was similar in the two groups by the end of the period. The reduced PMNL phagocytic capacity observed following repeated hypobaric hypoxia may have consequences for host defence in situations of exposure to hypoxia.

The development of quantified EEG (qEEG) in the form of frequency domain mapping has provided methods of automated analysis to detect normal and abnormal physiological states as well as definite neuropathological states in the brain. There is considerable importance in the various high risk military occupational environments to be able to detect incipient cerebral hypoxia, in order to prevent incapacita-

tion due to hypoxia in real time. This paper presents the current data which have been gathered and analysed at DCEM, NDMC and the Ottawa Civic Hospital in the development of automated models of detecting cerebral hypoxia using frequency domain analysis of EEG. The basic method of analysis of spectral shifts of frequency domain spectra in epochs of 4 seconds of time. The results obtained show the spectral changes in normal wakeful individuals, normal individuals undergoing hyperventilation and volunteers subjected to levels of graded hypoxia. The results from forty eight subjects of average age of 22 years performing hyper-ventilation as part of clinical EEG showed a large spectra shift in keeping with the slowing seen on time domain EEG. The results of three subjects exposed to three levels of oxygen saturation showed at 80% saturation an initial decreased peak frequency with increase in amplitude. At 70% saturation, there was a decrease in amplitude with a flattening and widening of the spectral pattern.

The pilotage of modern military aircraft is highly specific activity which requires a perfect efficiency of the CNS including the coordination between the cortex, subcortical centers and separate effectors. The work of a pilot in the cockpit of current aircraft, typical with a lack of space, large number of controllers and instruments is connected with the necessity of immediate reactions during the information, gravitational and emotional overloads, thus making the demands on pilot's CNS functions enormous. The aim of flight surgeons, assessing the flying ability of the pilots is to admit only the individuals in perfect health condition. The head injury is undoubtedly a serious harm to the delicate brain functions. We should like to share with this competent forum the experience, obtained by the neurological department of the Institut of Aviation Medicine, Prague with the aeromedical assessment of these events in Czech, formerly Czechoslovak Air Force flying personnel during a period 1987 - 1994.

COGSCREEN-AEROMEDICAL EDITION IN THE ASSESSMENT OF THE HEAD INJURED MILITARY AVIATOR

Moore, J. L., Naval Aerospace Medical Inst., USA; Kay, G. G., Naval Aerospace Medical Inst., USA; Apr. 1996; 6p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

CogScreen-Aeromedical Edition (CogScreen-AE) is a computer administered and scored cognitive screening instrument designed to rapidly assess deficits or changes in attention, immediate and short-term memory, spatial-perceptual functions, calculation skills, reaction time, simultaneous information processing, and executive functions. The test was designed to detect subtle changes in cognitive functioning, which left un-noticed may result in poor pilot judgment or slow reaction time in critical operational situations. Normative data have been collected on over 800 commercial airline pilots and an equal number of military aviators. This paper will focus on applications of CogScreen-AE in the evaluation of head injured military aviation personnel. The CogScreen test results from a group of 24 mild to severely injured military aviators who were tested up to 90 months following head injury, and five of whom received serial evaluations, are presented. The results of the serial evaluations of five head injured military aviators are also discussed. Results demonstrate the sensitivity of the test to initial injury severity and recovery of function. The combination of conventional neuropsychological instruments and CogScreen-AE may expedite the return of head injured aviators to flying duties and actual control of aircraft.

CARBOHYDRATE DEFICIENT TRANSFERRIN: A NEW MARKER TO EVALUATE ALCOHOL CONSUMPTION IN PILOTS

Freund, Wolfgang, German Air Force, Germany; Apr. 1996; 8p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

To test the possible value of new, commercially available test kits for Carbohydrate Deficient Transferrin (CDT) in an aeromedical setting, a clinical trial followed by an alcohol consumption trial have been conducted at the German Air Force Institute of Aviation Medicine (GAF IAM). The clinical trial with 268 tests showed that CDT is a valuable and accurate new tool in the assessment of alcohol consumption in otherwise healthy persons. The alcohol consumption trial showed that tests for CDT can not detect the difference between abstinence and consumption of 25ml of alcohol / day for three weeks. However, CDTest seems to be more stable than % CDT.

EXTENDING THE RANGE OF VISION TESTING: THE SMALL LETTER CONTRAST TEST

Rabin, Jeff C., Army Aeromedical Research Lab., USA; Apr. 1996; 8p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Recent evidence suggests that small letter contrast sensitivity (CS) is more sensitive than visual acuity (VA) to defocus, luminance, binocular enhancement, and visual differences among pilot trainees. It would be valuable to make this test available for general use. We developed a hard copy (letter chart) version called the Small Letter Contrast Test (SLCT) and evaluated its sensitivity and reliability in comparison to standard vision tests. The SLCT has 14 lines of letters with 10 letters per line. The letters are of constant size (20/25 at 4m), but vary in contrast by line in 0.1 log steps (0.01 log units per letter). Normal room illumination is used. The SLCT was evaluated in 16 subjects under various conditions (spherical and astigmatic blur, low luminance, two eyes vs. one) to determine test sensitivity and reliability, and in patients with clinical conditions. Scores were compared to those obtained with standard tests of VA (Bailey-Lovie) and CS (Pelli-Robson). SLCT scores were similar to previous measures, and retest reliability was one line. The SLCT was more sensitive than VA to spherical and astigmatic blur, low luminance, and vision with two eyes vs. one. Greater sensitivity of the SLCT endured despite correction for variability. The SLCT also was more sensitive than standard tests to visual loss from early cataract, keratoconus, corneal infiltrates, edema, and amblyopia. The SLCT is a powerful approach for revealing subtle visual loss which may be undetected by standard clinical techniques. The SLCT will prove useful for monitoring vision in refractive surgery, cataract, corneal and macular edema, optic neuritis, and for evaluation of candidates for unique occupations like aviation.

OPTIC NERVE HEAD DRUSEN: AN EXAMPLE OF AEROMEDICAL DECISIONS REGARDING VISUAL FIELD LOSS

Burroughs, John R., Armstrong Lab., USA; Ivan, Douglas J., Armstrong Lab., USA; Thomas, Robert A., Armstrong Lab., USA; Tredici, Thomas J., Armstrong Lab., USA; Gooch, John M., Armstrong Lab., USA; Apr. 1996; 4p; In English; See also 19960053795; No Copyright; Avail: CASI; A01, Hardcopy; A03, Microfiche

Peripheral vision is a vital function which serves to alert the aviator to a potential target that may deserve closer attention. The confrontation technique for visual field testing is an invaluable tool for use by the flight surgeon to screen for defects without the need for bulky equipment. Yet this technique may miss field defects of potential aeromedical significance. Optic nerve drusen are known to cause progressive visual field disturbances. Formal visual field testing is necessary in order to properly evaluate an aviator with a condition such as optic nerve drusen. We reviewed our experience with 18 aviators at the Aerospace Consultation Service who received the diagnosis of drusen of the optic nerve. The influence of drusen on visual

function and on the aeromedical waiver recommendation process is discussed in order to provide insight regarding appropriate aeromedical management.

TRANSIENT VISION LOSS IN AIRCREW

Burroughs, John R., Armstrong Lab., USA; Ivan, Douglas J., Armstrong Lab., USA; Tredici, Thomas J., Armstrong Lab., USA; Perez-Becerra, Jose, Armstrong Lab., USA; Apr. 1996; 14p; In English; See also 19960053795; No Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

Etiologic factors that can result in transient disruptions in vision comprise an extensive differential diagnosis and include both central nervous system and systemic causes. Aircrew are not immune to the majority of these etiologies and their vulnerability expands as they extend their flying careers. Furthermore, the aviation environment may introduce additional pre-disposing factors. This paper concentrates on those etiologies that are felt to be the most common or unique clinical entities potentially responsible for transient visual changes in aircrew and highlights specialized cases that relate directly to the aerospace environment, such as altitude-related phenomena. Management and disposition of aircrew with these problems often times presents a unique occupational dilemma. When applicable, the USAF ACS's experience with specific diagnoses related to transient visual loss or transient visual disturbances in aircrew is discussed.

LIMITATIONS OF CNS FUNCTION IMPOSED BY VIBRATION IN FLIGHT

Diamantopoulos, Ioannis I., Hellenic Air Force General Hospital, Greece; Kechagiadakis, Eleutherios, Hellenic Air Force General Hospital, Greece; Apr. 1996; 12p; In English; See also 19960053795; No Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

Vibration constitutes any form of motion that repeatedly alternates in direction. It is usually perceived by the senses as a series of sustained, mechanical, oscillatory disturbance. In everyday life as well as in aviation, vibrational energy reaches the body directly, by means of contact with a vibrating surface, or indirectly, by transmission through intervening bodies such as solids or fluids. When transmitted through air and bears characteristics in the audible range is treated as noise.

In studies on the CNS and the Immune System, both with a great capacity to receive and respond to any kind of stimulation - exterior as well as interior - it has only recently been considered that both are not completely autonomous, but that the interrelationship is more and more complex as investigations reveal new facts. According to ADER(1,23), all homeostatic defense organic systems are subject in a greater or lesser degree to the influence of environmental circumstances and psychological factors, whose integration evokes an adaptive response which, at the last moment, is regulated by the brain and whose consequences on health are not very well known at present.

USE OF PSYCHOSTIMULANTS IN EXTENDED FLIGHT OPERATIONS: A DESERT SHIELD EXPERIMENT

Cornum, Kory, Army Medical Center, USA; Cornum, Rhonda, Army Medical Center, USA; Storm, William, Army Medical Center, USA; Apr. 1996; 4p; In English; See also 19960053795; No Copyright; Avail: CASI; A01, Hardcopy; A03, Microfiche

The present study examined the use of dextroamphetamine by F-15C fighter pilots during Operation Desert Shield, the five month build up after arrival in Saudi Arabia but before Desert Storm (Persian Gulf War). These pilots were tasked with providing a continuous defensive and deterrent position in front of vulnerable high value assets, and were flown as Combat Air Patrol (CAP) missions. Airborne Warning and Control Squadron (AWACS) jets flew 24 hours a day to monitor Iraqi air activity, and F-15C aircraft flew missions to protect the AWACS and Saudi Arabia from a surprise attack. The missions were typically 4-6 hours in length and were scheduled well in advance. Additionally there were plenty of aircraft and pilots available to fly these missions. Thus, the pilots were well rested before all of these flights.

SUSTAINING HELICOPTER PILOT ALERTNESS WITH DEXEDRINE (R) DURING SUSTAINED OPERATIONS

Caldwell, John A., Jr., Army Aeromedical Research Lab., USA; Caldwell, J. Lynn, Army Aeromedical Research Lab., USA; Crowley, John S., Army Aeromedical Research Lab., USA; Apr. 1996; 12p; In English; See also 19960053795; No Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

Sustained operations are a tactical necessity on the modern battlefield. However, the strain on personnel from sleep deprivation and fatigue remains problematic. Effective crew work/rest policies may prevent sleep loss and subsequent performance decrements in some situations, but stimulant medications may be the only alternative for sustaining performance in unpredictable combat operations. The present study investigated the efficacy of using dextroamphetamine as a countermeasure to sleep loss during sustained operations. Twelve subjects (6 males and 6 females) were exposed to two, 40-hour periods of continuous wakefulness during which they flew a helicopter simulator and completed electroencephalographic (EEG) and mood evaluations. During the final 23 hours of one period, subjects were administered 3 separate 10-mg doses of Dexedrine (at 0000, 0400, and 0800), and during the final hours of the other period, subjects were administered placebo. Test sessions occurred at 0100, 0500, 0900, 1300, and 1700 on both days. Results showed that flight performance was better under Dexedrine than placebo on 7 out of 9 sets of maneuvers. The benefits from Dexedrine were particularly apparent during the 0500 and 0900 flights when the combination of fatigue and circadian effects were most severe. Both EEG and mood evaluations were consistent with the performance effects in that Dexedrine was found to reduce slow-wave brain activity (associated with fatigue) and improve subjective ratings of vigor, fatigue, and mental abilities. These data indicate that Dexedrine(R) is a viable countermeasure for sustaining the performance of both male and female pilots when operational demands prevent adequate, restorative sleep.

THE EFFECT OF MODAFINIL AND AMPHETAMINE ON CORE TEMPERATURE AND COGNITIVE PERFORMANCE USING COMPLEX DEMODULATION DURING 64 HOURS OF SUSTAINED WORK

Pigeau, Ross, Defence and Civil Inst. of Environmental Medicine, Canada; Naitoh, Paul, Applied Psychophysiology Group, USA; Apr. 1996; 12p; In English; See also 19960053795; No Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

Modafinil (diphenylmethyl-sulfinyl-2 acetamide) is an alerting substance that is considered safer than amphetamine with fewer side effects. It appears to produce no feelings of euphoria, does not seem to be addicting, induces no drug tolerance and in large dosages

(greater than 4500 mg) does not produce serious medical problems. These features make modafinil a good candidate to reduce or ameliorate the effects of prolonged sleep loss in military operations. The validity of these claims, however, is in question due to the very few number of controlled studies using normal adult subjects. Modafinil has been used primarily in either clinical studies to treat sleeping disorders or in animal studies to investigate its pharmacological properties. Modafinil is described as an alpha-1 adrenergic agonist, but Mignot et al. have recently questioned this interpretation, reporting that modafinil had good selectivity for the dopaminergic transporter. Nevertheless, the relatively benign psycho-pharmacological properties of modafinil make it a good candidate to reduce or ameliorate the cognitive effects of prolonged sleep loss under continuous workload conditions. Presently, use of modafinil in Canada is limited to scientific and/or clinical investigations.

Especially due to the catecholamines compartment of stress managing, the microfocal dispersed changes of the myocardium are observed, the result of which is the myocardial electrical instability. In clinic these changes are known as predisposition to the life-threatening arrhythmias and/or to the sudden cardiac death. Late potentials (LP) are considered the manifestation of myocardial electrical instability in the body surface potential distribution within the electrical field of the heart. Standard procedure of late potential extraction is based on signal averaging of 3 ECG's from 200 to 400 electrical systoles, i.e., in the interval of two to six minutes. Discussed limitations are suppressed by developed procedure of LP extraction from single electrical systole. Input data is the matrix of eighty simultaneously measured ECG's and three vectorcardiographic ECG's from single systole. Singular Value Decomposition allows the noise suppression by exclusion of higher order (i.e., over the twentieth) orthogonal components from final signal reconstruction. From the mentioned hypothesis of the relationship between coping with influence of psychosocial stressors and LP origination was adopted. Data from 48 healthy subjects (mean age = 42.68 years, SD = 14.65) and 29 subjects (mean age = 49.14 years, SD = 19.15) with sustained ventricular tachycardia proved by programmed ventricular electrical stimulation were analyzed. Using the logistic regression 81.82% (81.25% of healthy and 82.76% of subjects with sustained ventricular tachycardia) were correctly classified. Thus, single beat LP extraction appears to be a suitable compartment of methods for the early diagnostic of health risks of influence of psychosocial stressors especially within the subjects with high level of importance of possible risk of human factor failure (as pilots and/or air-traffic controllers).

ANAEROBIC CAPACITY AND HEIGHT RELATIONSHIP TO SIMULATED AIR COMBAT MANEUVER (SACM) - DURATION

Lenler-Eriksen, O., Royal Danish Air Force, Denmark; Selection and Training Advances in Aviation; Nov. 1996; 6p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

A method to measure a pilots anaerobic capacity, correlated for height transfer this to an arbitrary measure for 'G duration tolerance' (GDT) is described. Results from 10 subjects from The Armstrong Laboratory, shows a significant correlation between GDT and SACM duration (P = 0.03). The method could be an inexpensive tool to get a picture at pilots SACM duration tolerance.

Anti-G protection by means of ventilator high pressure is currently being evaluated within the Rafale test program. Before use of this means of protection in actual flight, training of pilots in a centrifuge unit is recommended. This training has the goal to demonstrate to the pilots the tolerance improvement that can be achieved by means of positive pressure ventilation and sensitizing them to ergonomic and physiological particular features of this kind of anti-G protection. It is also intended to verify nominal functioning of pilot personal protection devices. Eighteen test pilots were subjected to three acceleration profiles. For the first profile they did not have any anti-G equipment. For the following profiles they wore an anti-G suit, either alone (second profile) or combined with ventilator high pressure device (third profile).

ECHOCARDIOGRAPHY IN NATO AIRCREW: A MULTI-NATIONAL STUDY L'ENCHOCARDIOGRAPHIE CHEZ LES PILOTES DE L'OTAN- UNE ETUDE MULTINATIONALE

Apr. 1997; 104p; In English
 Report No.(s): AGARD-AR-351; ISBN 92-836-1052-0; Copyright Waived; Avail: CASI; A06, Hardcopy; A02, Microfiche

Based on physiologic considerations and observations in animal experiments, a serious concern was raised: that repeated exposures to increased radial acceleration forces (+Gz) might have a deleterious effect on the pilot's heart. This concern was supported by the results of a preliminary echocardiographic (heart ultrasound) study carried out by French researchers and reported to AGARD in 1985. There were a number of uncontrolled variables in that initial study, including the amount of exercise and smoking. The investigators cautioned against forming any definite conclusion and recommended further studies. Because of these potentially serious occupational concerns and the findings of the preliminary study, the AGARD Aerospace Medical Panel initiated a carefully controlled study using echocardiography to compare current NATO pilots flying high-sustained G (HSG) aircraft with a control group of transport and rotary wing pilots. HSG aircraft were arbitrarily defined as those designed to maintain greater than +7Gz for at least 15 seconds, e.g. F-15, F-16, F-18, Mirage 2000, Hawk. Working Group 13 designed a protocol by which investigators from many NATO countries could contribute data to a central database. The study was carried out by Working Group 18 and involved over 30 investigators from 13 NATO countries. Data were collected and transmitted for analysis and quality control to a central database at the USAF Armstrong Laboratory at Brooks Air Force Base, Texas. Over 1600 echocardiograms were entered into the database. Data analyses compared 289 pilots of high sustained G (HSG) aircraft with 254 control pilots. The results conclusively show that there is no effect of HSG flight on the heart. The conclusions are limited to the resolution of the technology employed (echocardiography) and to the flight envelopes utilized in the current generation of NATO HSG fighter aircraft. The study serves as a model by which other military occupational medical questions may be addressed quickly and efficiently by the AGARD Aerospace Medical Panel.

The AGARD Aerospace Medical Panel sponsored a Workshop on the Medical Surveillance of Subjects for Acceleration Research. There remain unanswered questions about the possible long-term medical complications of repetitive exposure to G forces. The outcome of the Workshop includes a consensus protocol for medical screening of subjects for acceleration research, and a protocol for a database to track medical occurrences of NATO centrifuges.

EFFECTS OF ACTIVE NOISE REDUCTION ON NOISE LEVELS AT THE TYMPANIC MEMBRANE

Wagstaff, A. S., Royal Norwegian Air Force, Norway; Woxen, O. J., Royal Norwegian Air Force, Norway; Jun. 1997; 6p; In English; See also 19970026380; Sponsored in part by Norwegian Air Ambulance; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Active noise reduction (ANR) is an electronic system that works by continuous sampling of noise inside the earshell of the headset with a small microphone. This signal is inverted in phase through the headset speaker, thus reducing noise levels by destructive interference of the acoustic field. The system provides good low-frequency noise attenuation, but air crew differ in their subjective opinion of ANR. The present study is an attempt to provide an objective assessment of the effect of ANR on noise levels at the tympanic membrane. Seven subjects with normal ears were placed in an environment of recorded noise from a BO-105 helicopter. A microphone probe was inserted to within 5 mm of the tympanic membrane of each subjects right ear. Noise levels in the ear were measured without a headset and with two different ANR headsets. Measurements were performed with and without the ANR system on, and, with and without white noise through the headset communication system. The white noise was used to simulate aircraft communication noise. The two headsets tested had differing levels of passive and active attenuation. The ANR system produced a substantial low-frequency attenuation. However, noise levels in the mid frequencies increased somewhat when the ANR system was switched on. This effect was augmented when white noise in the communications system was introduced, particularly for one of the two headsets. Low-frequency noise attenuation of ANR systems is substantial, but an increased mid-and high frequency noise level caused by the ANR may affect both communication and overall noise

levels. Our data provide advice on what factors should be taken into account when ANR is evaluated for use in an aviation operational environment.

BURN HAZARD IN AIRCRAFT FIRES

Knox, F. S., III, Armstrong Lab., USA; Billotte, Bill, Wright Lab., USA; Ringhand, Stacy, Wright Lab., USA; Sep. 1997; 10p; In English; See also 19970034906; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Anyone who has seen a burn patient knows that burns are very traumatic, even life threatening, and often require more medical care than any other trauma. Moreover, the physical trauma is just the start; in many cases it is followed by psychological trauma. The psychological trauma can last a lifetime, daily reinforced by the disfigurement which often accompanies severe burns. Burn trauma teams now recognize this and employ psychological specialists who start therapy right along with the medical/physical therapy. All this extensive care costs a great deal of money. For all concerned, the best course is to prevent fires through good design practice. For example, the US Army was able to cut the incidence of burn injuries in survivable crashes to nearly zero by equipping its helicopters with crashworthy fuel systems and having its aviators wear protective flight suits. Part of the justification for that retrofit program was based on the cost of treating burned aviators and training their replacements. The retrofit program turned out to be both the humanitarian and cost effective thing to do. Part of calculating the cost/benefit of proposed fire safety measures is to be able to assess burn hazard with some accuracy. For example, one protective device worn by today's military pilots is their fire retardant flight ensemble. Historically these uniforms were tested in several ways. First, basic simple flammability tests showed which fabrics might be good candidates. The next step was to assess burn protective capability of various fabrics and fabric constructions. This protective capability was assessed by passing ensembles through fuel fires in an outdoor fire pit or by testing fabrics using pigs as aviator surrogates or by using heat flux sensors to measure heat transmitted through the ensemble and then using math models to predict the burn damage. The purpose of this paper is to focus on the burn prediction model, BURNSIM, and discuss its application to the study of fire/thermal sources in aviation. The model was originally developed to replace the use of pigs in testing protective fabrics, but subsequently has been applied to other cases such as side-by-side ejection seats, live fire testing and aerothermal heating during high MACH escape. Each of these applications will be discussed after presenting the burn model in some detail.

IMPACT HEAD INJURY: RESPONSES, MECHANISMS, TOLERANCE, TREATMENT AND COUNTERMEASURES LES TRAUMATISMES CRANIENS CONSECUTIFS AUX IMPACTS: LES MECANISMES, LA TOLERANCE, LE TRAITEMENT ET LES CONTREMESURES

Nov. 1997; 242p; In English; Impact Head Injury: Responses, Mechanisms, Tolerance, Treatment and Countermeasures, 7-9 Nov. 1996, Mescalero, NM, USA; See also 19980003880 through 19980003902 Report No.(s): AGARD-CP-597; ISBN 92-836-1062-8; Copyright Waived; Avail: CASI; A11, Hardcopy; A03, Microfiche

These proceedings include the Technical Evaluation Report, a Keynote Address, and 23 invited papers, of the Specialists' Meeting sponsored jointly by the AGARD Aerospace Medical Panel, the Stapp Car Crash Conference Advisory Committee and the Society of Automotive Engineers. Severe head injury resulting from vehicular accidents is a major concern to military and civilian health care workers. Significant advances have been made in the understanding of the causes of severe brain injury and in the factors, both direct and indirect, that contribute to the pathophysiological changes that follow from

a severe head injury. Moreover, advances in design and the proper use of countermeasures can significantly reduce head injuries causing death. This Specialists' Meeting addressed the issues of severe head injury from the point of view of: (a) the dynamic response of the head during impacts; (b) brain injury mechanisms in diffuse axonal injury; (c) physical and computer models for assessing injury severity; (d) human tolerance and injury criteria; (e) head injury assessment and treatment; (f) epidemiology in head injury mishaps; (g) harmonization and enforcement of standards for protective head gear; (h) personal protective systems in aircraft; and (i) computer simulations for optimizing head impact protective designs. These proceedings will be of interest to military and civilian medical professionals, accident investigators, safety engineers and research scientists concerned with safety issues in vehicular crash protection. They will also benefit the research manager and scientist or flight surgeon requiring a state-of-the-art review of relevant research in the field of impact head protection.

SOME OBSERVATIONS TO THE SKULL-BRAIN TRAUMA

Kallieris, Dimitrios, Heidelberg Univ., Germany; Rizzetti, Andreas, Heidelberg Univ., Germany; Mattern, Rainer, Heidelberg Univ., Germany; Impact Head Injury: Responses, Mechanisms, Tolerance, Treatment and Countermeasures; Nov. 1997; 4p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

Skull-brain injuries are caused through impact against rigid or padded obstacles. Injury pattern and injury severity of skull-brain trauma from experimental head impacts and autopsy cases are reported. The experimental part includes 10 head impacts (frontal, lateral or occipital and rigid or padded) with cadavers at a velocity of 20 km/h. A pneumatic impactor with a movable mass of 23 kg was used, the impact surface was a disc with 150 mm of diameter. Accelerations at the top of the head and the epidural pressure at the contrecoup site were measured. According to the acceleration measurements at the top of the head c.g. amounts between 85 g (padded) and 500 g (rigid); the rotational acceleration of the head around the rotation axis varies between 4700 rad/sec(sup 2) (padded) and 19000 rad/sec(sup 2) (rigid). Furthermore, the epidural pressure is between -20 kPa and -46 kPa. The observed fracture pattern and the injury severity of the skull are well comparable between the experimental exposure and the head impact during a sudden fall on the road. Furthermore, the injury pattern of the brain is also comparable, however, not the injury severity; the haematoma is of higher intensity in the accident cases. The brain injuries of the experiments include contrecoup subarachnoidal haematomas; furthermore skin lacerations were observed. The results are critically discussed with those existing in the literature.

The purpose of the present study was to determine the force-deflection biomechanics of the human cadaveric intact head under quasistatic and dynamic loading. Both nonfracture and fracture studies were conducted under known boundary conditions to delineate the stiffness, energy, and force-deflection characteristics for future use in finite element investigations and helmet protection studies.

A cadaver head and neck impact model has been developed to produce a wide variety of clinically observed cervical spine injuries and basilar skull fractures. The impact model includes a drop track which allows impact of the head and neck with a simulated torso mass following into an obliquely oriented surface with varying amounts of surface padding. Twenty unembalmed ligamentous cadaver head-neck specimens have been dropped in an inverted posture with the head and neck in the anatomically neutral position. Multiaxis transduction recorded head impact forces, planar head accelerations, and neck reactions. In addition, the impact tests were imaged using a high speed imaging system at 1000 frames. The head-neck-torso response was bimodal, including a head inertial loading mode followed by a neck-impact surface loading mode. A total of three basilar skull fractures were produced among 16 specimens suffering injuries, one in an impact to a rigid surface, and two in impacts to padded surfaces. Additionally, each of these injuries occurred in the neck-impact loading mode and were therefore unrelated to peak head impact force, or head acceleration. These data suggest that these injuries may occur with greater frequency than previously thought. They also suggest that some basilar skull fractures occur mechanistically like neck injuries and are not likely to be mitigated with the addition of impact surface padding.

THE ROLE OF KINETIC LOADING PARAMETERS ON THE SEVERITY OF DIFFUSE AXONAL INJURY IN CLOSED HEAD INJURY

Miller, R. T., Pennsylvania Univ., USA; Smith, D. H., Pennsylvania Univ., USA; Han, X., Pennsylvania Univ., USA; Xu, B., Pennsylvania Univ., USA; McIntosh, T. K., Pennsylvania Univ., USA; Meaney, D. F., Pennsylvania Univ., USA; Nov. 1997; 8p; In English; See also 19980003879; Sponsored in part by Ashton Fellowship Contract(s)/Grant(s): R49/312712; NIH-NS-08803; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

In this report, we describe relationships between the kinetic loading parameters and the incidence of axonal injury in an experimental model of diffuse axonal injury used in our laboratory. Twenty animals (Hanford miniature pig, 13-20 kg, 3-4 months old) were injured using a coronal plane rotational acceleration of the head. Both the magnitude of angular acceleration and change in angular velocity were varied in these tests over a controlled range (56-260 krad/s (sup 2); 174-472 rad/s). Seven days following injury, injured brains were examined using immunocytochemical markers for injury (NF200, SMI-3, and SMI-32) and maps of both the axonal injury distribution and severity were produced for selected coronal planes. Analysis of these injury maps revealed that the extent of injury in the mid-hippocampal plane was reasonably correlated to kinetic loading parameters ($R=0.66, .76$), but that the correlations were less strong when focusing on specific intensities of axonal injury. Additionally, the severity of axonal injury in a given location, correlated to the loading parameters, but the changes were not statistically significant. Together, this study forms an important starting point for relating load parameters to injury within the brain, and can likely be improved with more advanced computational modeling capabilities.

A methodology to identify tissue level axonal stress and strain from macroscopic parameters is outlined. A non-linear, viscoelastic, structural relationship is proposed to describe the in vivo response of the guinea pig optic nerve to uniaxial elongation. The optic nerve is modeled as a bundle of parallel aligned axons undulated to varying degrees. When straightened, each axon displays non-linear, viscoelastic behavior that contributes to the overall behavior of the optic nerve. Optic nerves were examined microscopically to calculate the undulation of individual axons. Axonal undulation was found to follow a gamma distribution, with a mean undulation of 1.070 and a standard deviation of 0.053. A reduced relaxation function, consisting of two exponential terms, was approximated from in vivo, dynamic elongation of the guinea pig optic nerve. Results from the in vivo relaxation tests indicated that the relaxation behavior was independent of displacement, a requirement for linear, viscoelastic theory based on hereditary integrals. The instantaneous elastic function was expressed as an integral of the undulation distribution and a function of the stretch ratio. Initially, a linear stretch ratio function was assumed to analyze the effects of the undulation distribution on the instantaneous elastic response. These results were compared with those obtained by increasing the order of the stretch ratio function to a third order polynomial. The computed results of the proposed structural relationship compared well to the experimental data from in vivo optic nerve tests, indicating that this model could provide a framework for identifying axonal thresholds for traumatic injury.

MODELING CAVITATION DURING HEAD IMPACT

Nusholtz, Guy, Chrysler Corp., USA; Glascoe, Lee G., Michigan Univ., USA; Wylie, E. Benjamin, Michigan Univ., USA; Nov. 1997; 12p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The effects of stress in brain material was investigated with experimental and computational idealizations of the head. A water-filled cylinder impacted by a free traveling mass serves to give insight into what could happen to the brain during impact; particularly the effect of the state of stress on possible physical changes in the brain material. When the cylinder is struck by a free-flying mass of sufficient velocity, cavitation is initiated at the boundary opposite impact. Significant vaporous regions may develop at the boundary, while only limited vaporization occurs internally. The vaporization that does occur internally consists of diffuse micro-voids. Higher accelerations, or an additional loading of the domain by a constant acceleration perpendicular to impact, adds to the likelihood and to the increased severity of internal cavitation, increasing the size, number and density of micro-voids. As a result, the micro-voids that form may not only produce injuries in the typically perceived cavitation damage response, i.e., violent cavity collapse, but also by producing local large strains as a result of cavity formation. In addition, when a local section of brain is significantly populated with micro-voids, the bulk and shear properties can change. Therefore, cavitation-caused cellular damage, including a non-violent collapse mechanism resulting from stress in the brain material might be more common than previously thought. Cavitation occurred in these experiments at accelerations greater than 150 g's.

This paper demonstrates the potential of the WSU (Wayne State University) Brain Injury Model in predicting brain injuries sustained in a real motor vehicle crash. The particular case simulated here was a side impact in which the victim succumbed to multiple injuries, including a severe brain injury. The first step in the process was to use the EDSMAC code to obtain gross vehicular kinematics. The output of the EDSMAC run was used as input to a MADYMO simulation of the occupant kinematics and interaction with the vehicular structures of both the struck and striking vehicles. The computed head acceleration was then applied to the new three-dimensional finite element model of the head to determine the response of the brain to this crash loading. The injury severity was assessed by identifying areas of high shear strain and comparing them with autopsy data that showed locations of petechial hemorrhage where diffuse axonal injury (DAI) presumably occurred. The crash reconstruction revealed a possible head contact with the hood of the striking vehicle, even though no signs of contact were seen on the head at autopsy. The estimated resultant linear acceleration was about 220 g's. The estimated lateral angular acceleration was about 20,000 rad/s (sup 2). The estimated sagittal angular acceleration was about 11,000 rad/s (sup 2). Better estimation could have been made if more information were available. The shear strain distribution within the brain exhibited some degree of correspondence with the sites of DAI. It is very promising that the shear stress contours can be used to make predictions of DAI.

TISSUE LEVEL INJURY CRITERIA USING BRAIN FINITE ELEMENT ANALYSIS, BILATERAL IMPACT MODEL

Ueno, Kazunari, General Motors Corp., USA; Melvin, John W., General Motors Corp., USA; Nov. 1997; 16p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

A finite element model of a cortical impact experiment following double craniotomy was built and exercised independently with three different finite element programs, i.e., Dyna3d, Pamcrash and Abaqus as a partial validation of the protocol in establishing tissue level injury criteria for the head/brain subjected to an impact load. A typical experimental impactor motion (4 mm displacement in 1.5 ms, 5 m/s initial velocity) was successfully simulated in all programs and the results were favorably compared to each other in terms of overall stress values, time histories and distributions. The peak Von-Mises stress (120 kPa) was observed in the depth of the brain while the pressure peak (160 kPa) was observed at the surface of the brain. Both pressure and Von-Mises stress wave propagations were in accord with the theoretical wave speeds. The explicit programs (Dyna3d and Pamcrash) have a 600 fold CPU advantage and a smoother stress response compared to the implicit program (Abaqus).

USE OF FINITE ELEMENT ANALYSIS AND DUMMY TEST MEASUREMENTS IN THE ASSESSMENT OF CRASH IMPACT TRAUMATIC BRAIN INJURY

Bandak, F. A., National Highway Traffic Safety Administration, USA; Tannous, R. E., George Washington Univ., USA; Eppinger, R. H., National Highway Traffic Safety Administration, USA; Toridis, T., George Washington Univ., USA; DiMasi, F., Federal Aviation Administration, USA; Zhang, A. X., Conrad Technologies, Inc., USA; Nov. 1997; 14p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Three computational models were used to interpret experimental data as a first step in developing a process to predict traumatic brain injury (TBI) potential in motor vehicle crashes. The process and the prevailing conditions limiting its current viability are discussed. The

first model, a two dimensional model of the miniature pig brain, was gauged against existing experimental data using a previously introduced Cumulative Strain Damage Measure (CSDM). Results from this model were utilized in the analysis of output from two simple three dimensional models of the human brain one representing an adult and the other scaled in a crude attempt to simulate the six year old child brain. The miniature pig computer model was subjected to loads identical to those used in existing brain injury experiments. The human models were loaded using measured kinematic response data from actual crash dummy tests. The dummy test data was converted to model loadings using a previously reported method and a new experimental technique for measuring the spatio-temporal distribution of pressure resulting from head impact is also introduced. Twelve cases were analyzed using the two human finite element models. Six involved the Hybrid III dummy and six involved the six year child version of the dummy. The crash test results were evaluated on the basis of several proposed finite element based brain damage measures as well as the values of the Head Injury Criterion. Preliminary results indicate that the proposed procedure is feasible for the assessment of head injury potential pending the availability of material data and consistent load measurement processes.

HEAD INJURY RISK ASSESSMENTS BASED ON 15 MS HIC AND PEAK HEAD ACCELERATION CRITERIA

Mertz, H. J., General Motors Corp., USA; Prasad, P., Ford Motor Co., USA; Nusholtz, G., Chrysler Corp., USA; Nov. 1997; 10p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

A review is given of the development of the Head Injury Risk Curve (HIRC) which is based on 15 ms HIC, and the Skull Fracture Risk Curves (SFRC) which are based on the 15 ms HIC and the Peak Head Acceleration criteria respectively. Each of the risk curves was developed by analyzing the relevant cadaver head impact data using the Mertz/Weber Method which is a simplified form of the Median Rank technique. The Mertz/Weber Method was used to estimate the injury risk to the adult driving population because the test samples of cadavers were biased with specimens having poorer bone conditioning factors than the driving population. The Mertz/Weber Method is not affected by this type of bias since the form of the distribution curve is assumed apriori. The efficacy of the Head Injury Risk curve is demonstrated by noting that the predicted reduction in head injuries due to certification of American football helmets based on the HIRC was 78 percent compared to the actual reduction in head injury risk of 74 percent. The efficacy of the Skull Fracture Risk Curve based on 15 ms HIC is demonstrated using a finite element model of the head. There was no agreement between model results and the SFRC based on peak head acceleration since the time-dependency associated with bone failure is not addressed by the Peak Head Acceleration criterion. This limitation of the Peak Head Acceleration criterion is demonstrated by analyzing Transport Canada's 30 mph rigid barrier vehicle test results. Assuming a 5 percent risk of skull fracture as a design limit, then 20 tests would fail to meet this limit based on the 15 ms HIC criterion, but only 10 tests would fail based on the Peak Head Acceleration criterion. Further, it is noted that the proposed 80 G limit for Peak Head Acceleration is very design restrictive since it represents a 0.1 percent risk of skull fracture. The corresponding 15 ms HIC value for this level of skull fracture risk is 100.

This paper reviews the advances in management of non missile head injury over the past 30 years, and the factors known to affect outcome. It has proven difficult to exploit recent advances in the development of novel neuroprotective agents in patients with head injury and the reasons are explored together with the emerging role of multimodality bedside monitoring and functional brain imaging (Positron Emission Tomography and Magnetic Resonance) in defining more homogeneous sub-groups of patients for more focussed trials of such novel agents.

CLOSED HEAD INJURY AND THE MILITARY AVIATOR: ASSESSING COGNITIVE DYSFUNCTION AND SEIZURE RISK

Drew, William E., Armstrong Lab., USA; Patterson, John C., Armstrong Lab., USA; Nov. 1997; 4p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

Over the last several years, two concerns have become evident with respect to the aeromedical disposition of aviators following closed head injuries. The first problem is that aviators, even with mild closed head injuries, often have subtle cognitive impairment. This impairment is often not apparent on clinical examination or cursory mental health evaluation such as the Folstein Mini-Mental State Examination. The second problem is the risk of post-traumatic seizures primarily in aviators with moderate or severe closed head injuries. Both of these conditions clearly are problematic for the flying population in terms of information processing and sudden incapacitation. As task saturation poses a problem for individuals with the highest levels of cognitive functioning and psychomotor skills, i.e., "Top Guns", any cognitive impairment, to include cognitive slowing, poses a risk for flying safety. Clearly, sudden incapacitation, such as those resulting from post-traumatic seizure are incompatible with flying safety as well. An important aspect of closed head injury in occupational and aerospace medicine is the classification. Based on this classification, a research program has been developed to further study head injury as it relates to aeromedical disposition.

SECONDARY INJURY AFTER SEVERE TRAUMATIC BRAIN INJURY: MECHANISMS TOWARD WHICH CLINICAL TRIALS ARE TARGETED

Muizelaar, J. Paul, Wayne State Univ., USA; Nov. 1997; 4p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

In this paper, we cite literature showing that after traumatic brain injury (TBI) much of the damage is done well after the impact, even though the morphological appearance might suggest otherwise. The biochemical cascades leading to this secondary or delayed injury are demonstrated. Drugs are available to interfere with specific pathways or steps in these biochemical cascades. The general principals of clinical trials to test the safety and efficacy of these drugs are described: Double-blind, randomized, placebo-controlled design; Entry criteria, concerning the severity of the injury, mostly based on the Glasgow Coma Scale; Outcome measurement, mostly based on the Glasgow Outcome Scale. Specific drugs and the status of their clinical trials are also described: Oxygen radical scavengers and lipid peroxidase inhibitors have failed in large scale, phase III trials; NMDA receptor antagonists are currently in phase III trials. Different types of calcium channel blockers have been tested or are ready to enter into phase III trials. Some trials with drugs with different mechanisms or trials with new management strategies (hypothermia) are also mentioned.

Protection against brain injury has been the major concern of those who have been involved in the design of head wear for participants in dangerous pursuits. Various forms of head gear have been available throughout the ages for horsemen and those concerned with military pursuits. The development of engine driven vehicles and aircraft has led to empirically designed protective hats and helmets but, relatively recently, the scientific input into the design of helmets has become more noticeable. These have led to the creation of national and international standards for the design of helmets for various activities. One of the purposes of the studies, in which we have been involved, has been the evaluation of causes of brain injuries. Looking at these, with a view to brain protection, has led to a number of observations which seem relevant to the development of protective helmets. We have had the opportunity to study accidents and injuries in pedal cyclists, motor cyclists, horse riders, vehicle occupants, pilots and industrial workers, all of which groups have had helmets specifically designed for their use. An attempt is being made to provide information on mechanisms of brain injury in humans and to provide information on the value and performance of helmets.

Head injury remains the predominant cause of severe and fatal injuries to Army aircrew involved in helicopter mishaps. As a means to prevent injuries or reduce their severity, the U.S. Army has continuously sought improvements to aviator helmets. Numerous improvements have resulted from analysis of helmets involved in aviation accidents and the wearer's injuries. It is believed that the newest Army aviator helmet, the HGU-56/P, offers significant improvements over earlier designs. This paper presents a chronology of Army aviator helmets with descriptions defining their differences and improvements.

This Lecture Series addresses a critical aspect of the investigations related to the factors implied in the prevention of potential injuries among aircraft occupants as a consequence of impact and post-crash fires, heat and toxic fumes. It comprises a review of the critical aspects of injury prevention. The topics covered included a description of the acceleration vectors involved, how they may have an influence on the aircraft, and how the acceleration forces might be tolerated by the aviator. In addition, the physical analysis of impact and crash survivability is discussed, focusing on what happens during a mishap. Furthermore a review is made on how to evaluate the tolerable deceleration forces and occupiable space required to sustain life. A part of this LS is devoted to answering questions such as, when did the injury occur, the nature of the forces that produced the injury, and their relationship to a mishap. Injury types related to the thermal and intrusive impact of the deceleration forces are also discussed, as are aspects

related to the collection of medical information that would help identify the potential causes and the effects of an individual; in particular, the way in which the occupant moves in response to the forces applied. These forces may have a profound effect upon the nature and severity of the injury. This Lecture Series, sponsored by the Aerospace Medicine Panel of AGARD, has been implemented by the Consultant and Exchange Program.

HUMAN TOLERANCE TO ABRUPT ACCELERATION

Cugley, Jennifer, Royal Air Force Inst. of Aviation Medicine, UK; Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications; Feb. 1998; 8p; In English; See also 19980048994; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

Short duration accelerations resulting in injury or death can be inflicted not only on the occupants of vehicles involved in crashes, but also on pedestrians, sportsmen, persons falling from a height, and those exposed to explosions and bomb blast. The injury may be received when a person in motion comes into collision with a solid object or when an object or missile strikes a stationary person. Irrespective of the circumstances surrounding the accident, injury occurs when a person is exposed to forces of some magnitude for a brief period of time, and the degree of injury is related to the magnitude and duration of the applied forces. Hence, the study of accidental injury can be summarized as what we hit, how we hit it, how long we hit it for, how many times we hit it and which part of the body is subjected to the insult. For effective injury reduction programs to be introduced, an appreciation must be gained of the way in which accidents cause injuries, the nature of the forces contributing to the injuries and the characteristics of the type of accident under investigation.

A comprehensive review of the history of impact protection is clearly beyond the scope of the review. The interested reader is referred to the bibliography for the chapter on Biodynamics: Transitory acceleration in DeHart's Fundamentals of Aerospace Medicine. Suffice is to say here that the endeavor to protect occupants in aircraft crashes began with the pioneers of aviation and continues to the present day. It has met with considerable success but remains limited by the remarkable violence that can be wrought when fast moving objects meet fixed ones. The human body has a meager ability to cope with such violence without assistance and practical methods of assistance can only go so far. The basic line of attack on the problem have generally been to provide a container to surround the occupant, provide a seat and restraint to hold him there, limit the accelerations of the container to tolerable levels, provide personal protective equipment such as helmets, and control for post-crash factors such as fire or water landing. Ejection seats, capsules or modules were something of a special case, since they were intended to allow the occupant to avoid the crash altogether. However, they posed their own set of risks such as the ejection accelerations, windblast, altitude exposure, parachute opening shock, parachute landing, and a host of others. They made a real contribution in many cases, but they didn't make the problem of impact injury go away.

THE PHYSICAL BASIS OF IMPACT INJURY AND ITS PREVENTION

Raddin, James H., Jr., Biodynamic Research Corp., USA; Feb. 1998;

6p; In English; See also 19980048994; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

Effective prevention of injury in aircraft crashes and the investigation into injury occurrence in those crashes requires a knowledge of how impact injury occurs and how protective techniques work. This review will examine the physical underpinnings of the art of impact protection as applied to vehicular impacts. The same principles apply to terrestrial vehicles, aircraft, and spacecraft in a wide range of impacts and other sudden accelerations. Because they happen so rapidly, they are sometimes difficult to understand in terms of our slower moving daily experience. Some of the understandings may even be counter-intuitive as a result of the need to observe the event from various frames of reference. The review must therefore begin with some basic physics and apply those principles to the collision event. Approaches to describing crash motions and crash severity will be outlined before describing how to analyze occupant motions in a crash. The physics of injury will be briefly reviewed and applied in defining injury mechanisms and injury criteria. Finally, general approaches to crash protection will be addressed along with some perspectives on how to analyze and assess the effectiveness of crash protection. Example cases will be presented with the oral presentation to illustrate the application of the principles reviewed in the paper.

An aircraft accident is always an emotional event that triggers a flurry of activity, particularly if fatalities are involved. Rescuers, damage control crews, search and rescue teams, MEDEVAC teams, and support staff each play a well rehearsed role in activities surrounding the event. Every accident is unique, with its own set of circumstances, surroundings, mysteries and dangers. Initial confusion is always present. But amidst the wreckage, log of events, communication tapes, eye witness accounts, mission briefing, technical manuals, personal interviews and pathology lie important clues that, properly organized and understood, will indicate the cause and the consequences of the accident. The questions confronting an accident investigation board can vary, but usually involve two issues. The first centers on the cause of the accident. Explaining the cause is fundamental to future prevention of similar accidents. The task of making 'sense' from 'nonsense' can be awesome. An investigating team is usually confronted with a confused abundance of physical and human evidence, and an organized approach to information collection and analysis is needed to succeed.

Aircraft crashes are generally predictable in type and frequency. Different types of aircraft have different types of crashes. Similarly, occupant injuries follow generally predictable patterns, and themselves often consist of patterned abrasions and contusions reflecting portions of the aircraft structure. The role of the medical investigator and/or pathologist includes documentation and interpretation of these injuries to determine how the injuries occurred so that they may be minimized or prevented. The pathologist's documentation and interpretation of injuries, together with manifestations of natural disease processes, provides the core of the Human Factors data for analysis. As few pathologists are familiar with aircraft crash injuries, their interpretation of the injury patterns may be incorrect, which may significantly compromise the investigation.

LASER GENERATED 3-D SPACE DISPLAY IMAGES

Taboada, J., Advisory Group for Aerospace Research and Development, France; Aerospace 2020; Sep. 1997; Volume 3, 7-10; In English; See also 19990014353; Copyright Waived; Avail: CASI; A01, Hardcopy; A02, Microfiche

Conventional techniques of forming three dimensional (3-D) images on a two dimensional screen involve the use of electronic or optical tricks, such as the use of special eyewear. In a 3-D space display, however, the images are formed directly from luminous points distributed in all three spatial dimensions. Instead of pixels, one has voxels (volume-pixels). There are a number of approaches currently under development for 3-D space displays, some holographic and others mechanical, but the goal is to achieve a 3-D space display with no moving parts and a full 360 degree view requiring no special eyewear. This goal is within reach through the use of new two-photon laser photoexcitation techniques where two laser beams of different wavelengths intersect in a special transparent media. Fluorescence is emitted at the intersection where the combinations of the excitations creates the emissions. By multiplexing the laser beams throughout the media, a solid display object can thus be synthesized. This presentation will review the state-of-the-art of 3-D space display technology and develop a prospectus for future applications in air traffic control and mission management.

AEROMEDICAL SUPPORT ISSUES IN CONTINGENCY OPERATIONS LE SOUTIEN AEROMEDICAL LORS DES OPERATIONS NON PROGRAMMEES

September 1998; 420p; In English; In French, 29 Sep. - 1 Oct. 1997, Rotterdam, Netherlands; See also 19990025671 through 19990025721

Report No.(s): AGARD-CP-599; ISBN 92-836-0059-2; Copyright Waived; Avail: CASI; A18, Hardcopy; A04, Microfiche

These proceedings include the Technical Evaluation Report, two Keynote Addresses, 53 papers and the edited discussions of the Symposium sponsored by the North Atlantic Treaty Organization (NATO/RTO) Aerospace Medical Panel. It was held in Rotterdam, N-E from 29 September - 1 October 1997. Contingency Operations constitute military missions such as peacekeeping, humanitarian aid, peace-making/enforcement, full scale offensive operations and relief operations other than war, such as aid to civil powers in counterterrorism and in natural disasters. Increasingly, these operations will involve greater NATO participation in the post "Post-Cold-War" era. Significantly, NATO nations are turning to the application of science and technology, particularly computer resources, to address the unique problems associated with Contingency Operations. From a medical standpoint, there are many logistic, support and environmental factors which impede effective health and critical care medicine in Contingency Operations. This Symposium considered both the aeromedical problems encountered and the role of technological solutions as aids to resolving the issues in: (a) sustained and continuous operations, (b) medical management in remote locations, (c) medical information, and (d) adaptation to operational conditions. These proceedings will be of interest to heads of military health services, military and civilian officers

concerned with the health and safety of personnel in air and support operations, research scientists, and those requiring a state-of-the-art review of medical "lessons learned" in Contingency Operations.

SUSTAINED AIR OPERATIONS: PROLONGED DUTY OVERNIGHT

Nicholson, A. N., Royal Air Force, UK; Stone, Barbara M., Defence Evaluation Research Agency, UK; Aeromedical Support Issues in Contingency Operations; September 1998; 14p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Sustained air operations imply round-the-clock scenarios and, inevitably, prolonged duty overnight. The ability of crews to cope with such work-rest patterns depends to a large extent on obtaining sufficient sleep during critical rest periods. Hypnotics may be essential to ensure sleep as the rest periods themselves are limited in number and duration, and occur at all times of the day and night. However, even if good sleep is attained during all the available rest periods, there may still be much difficulty in sustaining alertness during duty overnight, particularly if the duty periods themselves are prolonged. This paper deals with the use of various potential interventions to sustain alertness during intensive air operations.

AIRCREW PERFORMANCE DURING EXTENDED SIMULATED BOMBER MISSIONS

Whitmore, J., Armstrong Lab., USA; French, J., Armstrong Lab., USA; Armstrong, S., B-2 OT and E Team, USA; September 1998; 6p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Research was conducted to determine if fatigue impacted the performance of aircrew during long-duration bomber missions. Sustained flight in excess of 36 hours with only a minimal crew aboard was examined in two studies. Sixteen male USA Air Force B-1B bomber aircrew participated in the study. The participants served in crews of four and performed three 36-hour experimental periods (missions) in a high-fidelity B-1B simulator. The missions were interspersed with 36-hour rest breaks. Speech, cognitive, physiological (EEG, temperature), and subjective fatigue data were collected approximately every three hours for 11 trials per mission. A MANOVA analysis revealed a significant effect of trials for the aggregated measures ($F(10,432) = 1.9885$, p less than 0.0001). This result, along with trend analyses, indicated a strong diurnal pattern in nearly all of the dependent measures. End-mission performance was similar to beginning-mission performance. Crews were able to perform the missions successfully; however, several areas of increased risk due to fatigue were observed. Crew rest strategies prior to, during, and following a mission are discussed. A second study is described which evaluated three long-duration B-2 missions.

REST MANAGEMENT AND THE DEVELOPMENT OF SIGNS OF FATIGUE IN PILOTS ACCORDING TO WORK SHIFTS GESTION DES REPOS ET EVOLUTION DES MANIFESTATIONS DE FATIGUE CHEZ LES PILOTES SELON LES ROTATIONS

Mollard, R., Paris V Univ., France; Cabon, P., Paris V Univ., France; Mourey, F., Paris V Univ., France; Bougine, S., Paris V Univ., France; Coblenz, A., Paris V Univ., France; September 1998; 10p; In French; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Fatigue in airplane pilots constitutes one of the most often mentioned factors among reasons for reduced work performance.

One of the available sources of information concerns the ASRS (Aviation Safety Reporting System), which allows American crews to report incidents confidentially. Analysis of these responses indicates that fatigue is explicitly mentioned in 4% of the events. Nevertheless, one can assume that fatigue is partially responsible for more than 20% of these incidents, given that other factors, such as inattention and communication problems, are often cited. Moreover, when pilots refer to fatigue, its associated causes prove to be quite diverse. Some pilots attribute it to lack of sleep, whereas for others long workdays or heavy workloads constitute the main causes for fatigue. One of the most frequently seen areas of confusion concerns the concept of sleepiness. Many studies conducted in real-life situations suggest that sleepiness and fatigue represent different ideas.

EVASIVE MANEUVERS AND HIGH-G FLIGHT SAFETY AFTER SLEEP DEPRIVATION

Chelette, T. L., Armstrong Lab., USA; Esken, R. L., Armstrong Lab., USA; Tripp, L. D., Armstrong Lab., USA; Albery, W. B., Armstrong Lab., USA; September 1998; 10p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

It is a common situation in the current global reach/global power mission to require fighter pilots to deploy overseas on short notice and to require immediate duty. Up to thirty six hours of sleeplessness is a common status in this environment. The objective of this study was to assess the performance of trained simulator pilots performing flight relevant tasks in the stressful environment of high G under two conditions; rested and 24 hours of sleeplessness. Performance was also compared to self-assessment and self reported effort and fatigue. Limited data was collected concerning a 2-4 week lay-off from the task. Volunteers (eight men & eight women) were trained to fly the Dynamic Environment simulator in a closed loop configuration air combat maneuvering up to 9 Gz. Before and after each session, their total body isometric strength was measured. During each sortie, thirty performance measures at simultaneous multiple tasks were measured. After each session, subjects completed a subjective questionnaire and a standardized subjective workload assessment. Neither male nor female overall performance was significantly affected by sleep status, although individual tasks showed sensitivity; call-sign reaction time was longer by 33% and missile survival was considerably less likely. Also, perceived effort and physical demand were higher while perceived performance was lower when sleepless. Greater self reported effort on the anti-G straining maneuver correlated with better task performance and less post-G fatigue. Men are naturally stronger than women, however there was no significant decrease in strength due to G exposure in either the rested or sleepless conditions for either gender. Though sleep deprived pilots' subjective sensations may be that they are fatigued and unable to perform, objective measures show that their ability to conduct offensive maneuvers remains unchanged after 24 hours without sleep. However, when conversion to uncertain and spatially demanding defensive maneuvers occurs, survival may be compromised.

PROS AND CONS OF STRATEGIC NAPPING ON LONG HAUL FLIGHTS

Valk, P. J. L., Netherlands Aerospace Medical Centre, Netherlands; Simons, M., Netherlands Aerospace Medical Centre, Netherlands; September 1998; 6p; In English; See also 19990025670; Contract(s)/Grant(s): CAA-97.058; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Long haul operations involve rapid multiple time zone changes and long, irregular work schedules. These factors can result in sleep loss, circadian disruption, and fatigue with consequent effects on pilot's performance and alertness. A controlled nap in the cockpit is considered to be a useful countermeasure to inflight fatigue. There-

fore, a study was conducted on the effects of a 40 minutes controlled rest period on the flight deck on crew performance and alertness. The alertness of the designated waking pilot, who has to remain alert while his colleague is resting, was explicitly assessed. Data was collected of 59 pilots, flying North-Atlantic B747-300 trips as scheduled in their regular duty roster. Pilots were equipped with a palmtop computer and an actigraph for objective and subjective assessment of quantity and quality of cockpit naps, alertness, and performance on a vigilance dual-task. During flights, measurements were performed before and after the rest period and before top of descent. It was found that a cockpit rest period improved alertness and performance of the rested pilots up to top of descent. Sleep during the rest period provided more improvement than rest alone. A number of designated waking pilots had difficulties in maintaining a sufficient level of alertness during the rest period of their colleague pilot. It is recommended to implement the use of preplanned controlled rest periods on the flight deck as a preventive fatigue countermeasure in 2- and 3-person flight deck operations. Measures to safeguard the alertness of designated waking pilots and guidelines to secure flight safety are discussed.

EARLY STARTS: EFFECTS ON SLEEP, ALERTNESS AND VIGILANCE

Simons, M., Netherlands Aerospace Medical Centre, Netherlands; Valk, P. J. L., Netherlands Aerospace Medical Centre, Netherlands; September 1998; 8p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Early starts and irregular work schedules might lead to disruption of sleep-wake rhythms with consequent sleep loss and fatigue. Fatigue is known to be a contributing factor to operational errors. The aim of this study was to determine the effects of early reporting times and irregular duty schedules on sleep, alertness and performance of pilots flying short-haul operations. Method: 6 Captains flying short-haul charters were measured during two 4-week periods. Subjects were equipped with a palmtop computer and an actigraph for subjective and objective measurement of sleep parameters, alertness, and performance on a vigilance dual-task. Each day subjects had to perform measurements before, during, and after flights and before and after the main sleep period. Results: It was found that pilots reporting before 06:00 a.m. had a significant shorter total sleep time, impaired sleep quality, and impaired performance both pre-flight and at top of descent. To a lesser degree, this also applied for reporting between 06:00 and 09:00 a.m. Degradation of sleep was most significant during the night prior to the start of a new duty period. Conclusion: Performance was primarily affected by inadequate sleep related to reporting times before 06:00 a.m. It is recommended that reporting times before 06:00 a.m. should be avoided, whenever possible. Pilots who have to report early, should try to anticipate insufficient sleep by advancing their sleep phase. This can only be achieved when early starts are planned on a regular basis. When irregular early starts are unavoidable, it should be considered to compensate for sleep reduction by planning sufficient time for recovery sleep.

Since waking and sleep are regulated by two distinct systems, there are two different methods to increase the duration of waking, either by stimulating the waking systems or by inhibiting sleep-inducing mechanisms. Some advances in the understanding of the mechanisms of drugs acting upon the nervous system have been recently obtained by the development of immunohistochemistry of early genes. Among them, the immunohistochemistry of CFos protein

is a good index of the neural systems which are activated after injection of drugs in animals. These data will be summarized together with the study of sleep which occurs after sustained wakefulness.

THE EFFICACY OF DEXTROAMPHETAMINE FOR SUSTAINING HELICOPTER PILOT PERFORMANCE: AN IN-FLIGHT EVALUATION

Caldwell, John A., Jr., Army Aeromedical Research Lab., USA; September 1998; 6p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The capability to operate 24 hours per day on the battlefield creates a tactical advantage over enemy forces. However, staffing shortages necessitating long work hours devoid of sleep eventually produce overwhelming fatigue, impairing performance and safety. In these situations, the only effective means to sustain performance may be the administration of stimulants. Unfortunately, studies of stimulants such as dextroamphetamine on the actual flight performance of aviators are virtually nonexistent. The present study assessed actual in-flight performance, mood, and alertness of UH-60 pilots during sleep-deprivation periods in which they were given either a 10-mg dose of Dexedrine or a placebo at 0000, 0400, and 0800 within the last 23 hours of each period. Results indicated better control (smaller RMS errors) of several flight parameters (i.e., heading, altitude, airspeed, etc.) under Dexedrine than placebo during straight-and-levels, climbs, descents, right turns, and a left-descending turn. Tendencies toward Dexedrine-related improvements also occurred in the left turns and the Instrument Landing System approach. The Profile of Mood States revealed reductions in fatigue, confusion, and depression concurrent with increases in vigor as a function of Dexedrine. Electroencephalographic data indicated enhanced central nervous system arousal under Dexedrine relative to placebo. No significant side effects occurred. It can be concluded that dextroamphetamine effectively sustained aviator performance during short-term sustained operations.

PHARMACOLOGICAL SLEEP MANAGEMENT: INTEREST OF MODAFINIL GESTION PHARMACOLOGIQUE DU SOMMEIL: INTERET DU MODAFINIL

Lagarde, Didier, Institut de Medicine Aerospatiale Armees, France; September 1998; 8p; In French; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

During sustained and continuous operations the sleep-wakefulness cycle is often disturbed: jet-lag, shift lag, prolonged sleep deprivation. The vigilance management in operational conditions includes pharmacological and non-pharmacological countermeasures. Sometimes non-pharmacological countermeasures, i.e. preventive, ergonomic and physical measures become inefficient or are inapplicable, so in these cases, military research teams are looking for pharmacological measures. There is a great variety of substances which may be used to reduce the effects of these sleep disturbances. These substances have to take place in a straight rule which could be resumed in 4 points: 1) an easy ingestion; 2) a quick effect after treatment; 3) a modulating time duration effect, dose-function; and 4) without side effects. Generally, three kinds of substances could be used: 1) hypnotic substances to induce a recovery sleep; 2) awakening substances to maintain a good level of vigilance; 3) synchronizer to resynchronize biological rhythms after jet-lag. In this work, the author presents an interesting synthetic substance called Modafinil (MODIODAL(R)). This substance is a medicine used to treat narcolepsy and hypersomnia. But modafinil could also act in healthy subjects, for example during a long sleep deprivation, and maintain a good level of vigilance and performance during 60 hours of continuous wakefulness. A neuroprotector effect at high dose has been demonstrated. The action mechanism of modafinil is complex. Modafinil modulates (as agonist) central post-synaptic alpha 1 noradrenergic receptor (wakefulness effect). At high doses, it increases dopamine level in nucleus accumbens (locomotor effect). It has also an indirect

participation in the serotonergic system (wakefulness effect). It induces a decrease of cortisol liberation of the GABA (wakefulness effect), and induces moderate transient increase in aspartate and glutamate (wakefulness effect) followed by long lasting decrease of extra-cellular excitatory amino-acids (neuroprotector effect). Modafinil increases a brain metabolic energetic compound: the phosphocreatine, and it induces an activation of proto oncogen c-fos in anterior hypothalamic nucleus. Modafinil (MODIODAL(R)) appears as an interesting substance in SUSOPS and CONOPS, easy to take, with a dose-effect to modulate the action. No major side effect was described. It is a waking substance and not an anti-sleep drug. Modafinil could be a very useful substance during real sustained operations but we have to take care of the wrong use.

Modafinil is currently being investigated in the context of sustained military operations as a potential countermeasure to the effects of extensive sleep deprivation (SD) on human cognitive performance. The aim of this present study is to analyze SD and dose-related effects of Modafinil on spatial cognition according to information processing patterns. Six normal healthy French military personnel participated for 4 one-week testing sessions involving double-blind, placebo-controlled manipulation of three doses of Modafinil (50, 150 and 300 mg/24hrs) during 60 hours of SD. Cognitive tasks investigated spatial abilities. Information processing data analysis indicates that Modafinil effectiveness is to be qualified based on the dose of Modafinil and psychological processes. Thus, Modafinil has more important beneficial effects on the serial processes which govern the speed of attentive spotlight scanning of the visual field, but a lower effect on the decision making processes involved in the same task. Regarding sensory interactions between vestibular system and vision, low doses (50 et 150 mg/24hrs) of Modafinil have beneficial effects, while a dose of 300 mg/24hrs produces effects which are similar to those observed with a placebo. Lastly, Modafinil have beneficial effects on mental imagery processes, however its effectiveness on mental image accuracy seems to be restricted to 48 hours of SD while vigilance is still well-preserved. This experiment suggest that sensorial integration processes, working memory and control operators are the preference target site for SD and Modafinil.

Sleep deprivation and desynchronization due to night watch, continuous operations or jet lag induce sleepiness and a decrement in performances: studies have shown that caffeine can be an effective

countermeasure in such circumstances. We evaluated a slow release caffeine (SRC), which delays the mean peak plasma concentration and lowers the plasmatic C_{max}. Tolerance of 600 mg SRC was assessed in a double-blind, placebo controlled, parallel-group study, involving 120 young adult males. This single dose of SRC was well tolerated by these rested subjects. Pharmacokinetic parameters were not influenced by acetylator status or caffeine use; however calmness and sleep onset were disturbed. Then in another experiment we evaluated in four sessions, 150, 300, 600 mg SRC and a placebo in 24 sleep deprived male and female subjects. Alertness and psychomotor performance were enhanced in both sex. The higher sensitivity to caffeine doses observed in the female group was related to greater susceptibility to sleep deprivation, and to increased salivary caffeine levels correlated with inferior body weight and use of oral contraceptives. Therefore the use of 300 mg SRC by fatigued subjects may significantly improve alertness and performance, with a wider acceptance and tolerance than other psychostimulants like dextroamphetamine.

Sleep deprivation is a consequence of modern military warfare. It leads to mental and physical performance decrement. Historically, psychostimulants have been widely used in the military context. Among them, caffeine is the most commonly taken, thus not prescribed, substance to cope with fatigue. Caffeine increases the level of alertness and the cognitive performance of fatigued personnel. Nevertheless, this effect is transitory and leads to chronic consumption and well known side effects. Recently, a slow release (SR) caffeine has been designed by NESTEC to improve its usability in sleep deprivation context. We present some data of an experiment conducted to answer the two following questions: 1) is SR caffeine an effective substance to maintain a good level of alertness during a 64-hours sleep deprivation?; and 2) is it able to alleviate the performance decrement of subjects? We will focus here on the results of the last objective.

Endogenous biological circadian rhythms are present in the majority of behavioural and physiological variables of all living organisms. These rhythms are entrained to the external environment in which they live, and get desynchronized as a consequence of transmeridian flights. This study has investigated changes occurring in various biological markers in air line pilots during and after westbound (Madrid-Mexico) and eastbound (Madrid-Tokyo) flights. The results have been compared to those of a non flying control group over a 6 day

period. A clear cut activity rhythm adapted to the local "Zeitgeber" was present over the whole period in controls as well as an evident rhythm in the urinary excretion of 6 sulfatoxy melatonin. Pilots showed alterations of the melatonin rhythm already on the day before of the flight, probably due to the desynchronizing effects of previous transmeridian flights. To Mexico, the rhythm remained adapted to Madrid in the first day and started to get adjusted to local time the second day. Pilots older than 50 years showed a higher resistance to change their excretory rhythm, to adjust to the local environment. The return flight to Madrid occurred in the middle of maximal 6 sulfatoxy melatonin excretion. Experimental subjects flying to Tokyo showed a complete disruption of the hormonal excretory, and of the activity rhythms. All subjects showed tiredness and anxiety at the end of the flights, being at a maximum when arriving to Tokyo. Pilots did not completely recover before the return flight.

AVIATOR'S GROUNDING TIME AFTER MELATONIN ADMINISTRATION DURING RAPID DEPLOYMENT MISSIONS

Comperatore, Carlos A., Army Aeromedical Research Lab., USA; Wright, Darlene, Army Aeromedical Research Lab., USA; Day-Clayton, Melanie, Army Aeromedical Research Lab., USA; Riuvera, Pik, Army Aeromedical Research Lab., USA; Bey-Wright, Regina, Army Aeromedical Research Lab., USA; Kirby, Albert W., Universal Energy Systems, Inc., USA; September 1998; 10p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The determination of drug-induced grounding time for aviation personnel can be derived from the drug's half-life, the assessment of hangover effects, and the evidence that sleep, alertness, and cognitive functions are normal some time after administration. Melatonin's half-life has been reported at approximately 60 minutes. Its side effects, particularly in the case of low doses no greater than 1 mg, generally are limited to drowsiness during the first 2 h after administration. This would imply that grounding time would be minimal for regimens employing 1 mg or less. However, the use of melatonin in rapid military deployments depends upon the development of regimens which can induce large advances or delays of circadian rhythms in relatively short periods of time (1-2 days).

During extended operations, crews often suffer from fatigue linked to rest periods that are quantitatively or qualitatively insufficient. These episodes of sleep deprivation are caused by many factors: workload, desynchronization during deployments across several time zones or during repeated night missions (or flying the latter exclusively), inadequate environmental sleep conditions (noise, extreme temperatures), excitability due to operations and combat stress. The use of soporifics is one of several means for optimizing crew rest periods. The ideal soporific for this purpose should be able to induce rapidly a period of sleep that is equal in quality to approximately 5 hours of physiological sleep and has no residual effects upon awakening, even for complex tasks such as pilotage.

Aeromedical evacuation is but one stage of medical treatment for surviving casualties of a military operation. Planning for aeromedical evacuation must take account of the overall medical estimate. This paper describes the factors that medical staffs have to take into account during the planning stage of military operation and draws attention to some of the lessons learned from recent operations.

For the past year, Critical Care Air Transport Teams (CCATT's) from Keesler Medical Center, Keesler AFB, Mississippi and Wilford Hall Medical Center, Lackland AFB, Texas have been deployed to support Operation JOINT ENDEAVOUR (OJE), the NATO peace effort in Bosnia. This is the largest operation involving the use of the CCATT's to date. A CCATT consists of a physician specializing in intensive care medicine, a critical care nurse, and a cardiopulmonary technician. The CCATT uses transport monitors, ventilators, portable blood analyzers and other medical equipment commonly used in our medical centers' intensive care units. The CCATT augments the standard aeromedical evacuation aircrew so that critically ill or injured patients may be evacuated from forward areas to definitive care hospitals. Otherwise, field hospitals in forward areas would have to provide care for these patients until they were stable enough to travel unaccompanied, creating huge logistical demands, or provide a physician to accompany the patient during evacuation, leaving forward field hospitals understaffed. Providing increased clinical capabilities aboard patient evacuation flights is not new. Several other nations' military medical services have extensive experience using enroute care providers to manage critically ill or injured patients during evacuation. During one year of the OJE deployment, the CCATT's moved 44 patients in 42 missions. Of these patients, 22 required mechanical ventilation during the flight. Eight missions were transatlantic flights to return patients to treatment facilities in the USA. CCATT's also redeployed to support the evacuation of foreign nationals from Liberia and rescue operations after the Khobar Towers Bombing in Dhahran. With the end of the "Cold War", a shift in military medical planning now calls for a reduced medical presence in areas of conflict and a subsequent increased reliance on patient movements out of theater for definitive medical and surgical care. The CCATT concept is an effective solution that fills the need for long range critical care air evacuation and easily integrates into the current aeromedical evacuation system.

With an increase in contingency operations in the NATO theater of operations, the Theater Aeromedical Evacuation System (TAES) needs to be flexible to meet the ever-changing demands of both combat operations and military operations other than war. Recent evolution in USA medical evacuation policies have made it necessary for the TAES to also change the way it does business. This paper discusses the composition of the TAES, recent additions to the TAES, trends in US medical policies, and implementation of the TAES during Operation JOINT ENDEAVOR/GUARD.

The current military medical system is designed to support 20th century combat: the forces involved in the conflict were large, powerful, and ponderous. Medical planning for conflicts such as these included several assumptions about the conditions involved (1) Discrete build-up phase - medical units would have time to assemble their assigned personnel and materials, and would be permitted to set up these facilities before use of the facilities would be required; (2) Large number of casualties; (3) Definitive care in theater - lines of battle were fairly stable; thus injured personnel would be treated in-theater until they reached a convalescent phase. At that point they would be returned to duty or evacuated from the theater; and (4) Traditional evacuation system - the Air Evacuation system would serve to transport patients who had been injured, but had essentially no ongoing requirements for medical care. The assets that were developed to meet the medical needs of these conflicts (the Air Transportable Hospital (ATH), Combat Support Hospital (CSH), and Fleet Hospital) are very capable and offer a variety of medically oriented services. They are essentially full-service hospitals packaged in a format that can be moved by air or sea. As full-service hospitals, they are quite large and heavy, and they require a significant amount of time and space to set up. The ATH (for example) is intended to be deployed in a modular or "building block" fashion, but this is implemented by bringing primary care capability into the theater first. Thus a full 50-bed ATH is necessary before trauma surgery or even an appendectomy can be performed. This set of equipment is packaged on 52 pallets, requiring airlift of seven C-141 aircraft.

Technologic advances have made laboratory testing feasible at the bedside. Point-of-care testing (POCT) allows medical providers to assess a wide range of clinical conditions in a rapid fashion at the site of patient interaction. While POCT has begun to impact on the delivery of care in the hospital setting, its potential for use in remote, field environments or during aeromedical evacuation is just being realized. In the civilian setting, discussion of POCT focuses on regulatory guidance, cost effectiveness, and reimbursement. Little attention has been paid in the literature to expanding the use of these capabilities beyond the traditional hospital boundaries. In this paper, we will briefly review the development of POCT and the associated technology. In addition, we will discuss the potential role of POCT in the field using current technology. Finally, we will review the available literature on use of POCT in the field.

Technological advances have made laboratory testing feasible at the bedside. Point-of-care testing (POCT) allows medical providers to assess a wide range of clinical conditions in a rapid fashion at the site of patient interaction. While POCT has begun to impact on the delivery of care in the hospital setting, its potential for use in remote, field environments or during aeromedical evacuation is just being realized. In the civilian setting, discussion of POCT focuses on regulatory guidance, cost effectiveness, and reimbursement. Little attention has been paid in the literature to expanding the use of these capabilities beyond the traditional hospital boundaries. In this paper, we will briefly review the development of POCT and the associated technology. In addition, we will discuss the potential role of POCT in the field using current technology. Finally, we will review the available literature on use of POCT in the field.

Point of Care (POC) laboratory devices have recently been utilized in medical centers to provide rapid results at the bedside of critically ill patients. The locations most commonly targeted are the Intensive Care Unit, the Operating Room, the Recovery Room and the Emergency Room. The impetus to use these devices is to provide immediate, accurate results of several critical laboratory values, especially those values that can change quickly. Instruments that can measure pCO₂, pO₂, pH, hemoglobin, hematocrit, sodium, potassium, chloride, glucose, urea, and ionized calcium and provide results in several minutes are already available. Technological requirements for a POC device include being small (less than 10 pounds), use small quantities of blood, can use AC or DC current, and require a minimum of effort to calibrate.

A significant portion of the military field medical footprint is currently consumed by post surgical patients, which according to current doctrine, must be stable before evacuation. This requirement results in a significant logistical burden for our ground forces. At present, we do not have adequate monitoring or therapeutic capabilities during ground or air transport to a definitive care treatment facility. In response to this need, we initiated a research and development activity to design and build a NATO-stretcher-based mini-intensive care unit that incorporates resuscitative and life-sustaining capabilities for field surgery and en route care. The LSTAT(trademark) has 3 basic components: (i) the base unit; (ii) a NATO stretcher; and (iii) a canopy that covers the entire patient. The LSTAT(trademark) base contains medical, diagnostic and therapeutic components while medical parameters, system performance data and user interactions are continuously monitored and logged by an on-board CPU. Provision is made for storage of up to 36 hours of physiologic and system performance data which can be uploaded to a local or remote host computer. When necessary, this data can also be communicated to the receiving hospital during evacuation for review by physicians to aid in their medical preparations for treatment. This facility provides a new life support capability for transport of marginally stable or unstable patients which integrates with existing NATO evacuation platforms.

AN INTEGRATED MEDICAL MONITOR FOR AEROMEDICAL USE

Dyck, W. R., Defence and Civil Inst. of Environmental Medicine, Canada; Nichols, A., CME Telemetry, Inc., Canada; September 1998; 8p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

As early as 1973, the Canadian Forces Medical System realized that medical monitoring of a casualty in the field, in the presence of an NBC threat, is very difficult. More recently, during the Gulf War, this deficiency was again addressed. A Canadian Forces (CF) requirement was written for a portable, integrated system for monitoring the vital signs of patients in the field, under adverse, unconventional conditions. Design considerations of such a device included that it be rugged, battery operated, easy to use, and yet be accurate enough to be useful as a monitoring tool. A project began, within the Canadian research and development branch, to identify existing technologies, to perform a feasibility study of developing the technology internally, and then to develop a vital signs monitor, if economical to do so. A CF version of a vital signs monitor was developed, and the technology was transferred to industry. The device, VITSEM 200 produced by CME Telemetry, is described, and available for demonstration. The VITSEM 200 can be used to monitor heart rate, body temperature, and blood oximetry continuously, and blood pressure when required. It measures 14.7 x 9.3 x 5.4 cm and weighs approximately 390 g. A version of the device (less the blood oximetry capability) has been evaluated successfully in a simulated NBC environment, and in a helicopter - deemed to be two of the most demanding adverse scenarios. The VITSEM 200 is currently being acquired by the Department of National Defence in sufficient quantities for user evaluations. If the user evaluations are successful, it is anticipated that the VITSEM 200 will become a new and valuable tool within all the medical elements of the CF.

SPINAL CORD INJURY TRANSPORT SYSTEM

Mason, Barbara-Marie, Department of the Air Force, USA; September 1998; 2p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A01, Hardcopy; A04, Microfiche

The USA Air Force Air Mobility Command (AMC) is tasked to provide the aeromedical evacuation of casualties in routine and contingency operations. To carry out this mission, AMC needs a medical support system suitable for transporting patients with spinal cord injuries and all types of extremity and cervical traction requirements. This

piece of equipment would be a Spinal Cord Injury Transport System (SCITS). The current method for transporting these patients is on the Stryker Turning Frame with a Collins Traction Device, for cervical traction. The system has been in use for over 20 years and is no longer logistically supported and must be replaced. The replacement system should provide a quality of care comparable to that available in fixed (ground) medical treatment facilities; i.e., a system that provides traction and kinetic therapy through incremental side-to-side rotation. Although SCITS will primarily be used for the previously mentioned patients, it would be beneficial and used for a variety of other patient conditions such as multiple trauma, burns, chest wounds, pulmonary complications, and post operative, depending on availability.

ADVANCED HYBRID OXYGEN SYSTEM-MEDICAL

Mason, Barbara-Marie, Department of the Air Force, USA; September 1998; 2p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A01, Hardcopy; A04, Microfiche

In 1993, a human system need request was submitted by Air Mobility Command to the Human Systems Center Plans and Program Office. This document tasked the aeromedical systems division to determine the feasibility of a hybrid oxygen system that could support the flight crew, patients and passengers on board an aircraft. What is currently available for flight crew is a variety of oxygen systems. There are liquid oxygen (LOX) systems, gaseous oxygen and onboard oxygen generating systems. The Patient Therapeutic LOX system is currently used for the patient therapeutic oxygen and passenger supplemental oxygen onboard some aeromedical evacuation aircraft. The limitations of existing onboard oxygen generating systems are they are not capable of generating or storing sufficient oxygen to meet patient and passenger needs.

MECHANICAL VENTILATOR PERFORMANCE DURING AEROMEDICAL EVACUATION

Grissom, Thomas E., School of Aerospace Medicine, USA; Papier, Kenneth S., Air Force Medical Center, USA; Lawlor, Dennis, Air Force Medical Center, USA; Farmer, J. Christopher, Air Force Medical Center, USA; Dordak, Stephen, Air Force Medical Center, USA; September 1998; 8p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Current USA military medical planning calls for a decreased medical presence in areas of conflict with increased reliance on patient movements out of theater for more definitive medical and surgical care. As a result, the aeromedical evacuation system will be moving patients with critical conditions and injuries faster and further than during past contingencies. This will include the movement of an increasing number of patients requiring mechanical ventilatory support. Advances in ventilator technology have led to the introduction of smaller and more capable transport ventilators. Some of these ventilators use built in air compression devices which remove the necessity of carrying an external compressor. In addition, manufacturers have incorporated newer modes of ventilation to improve patient tolerance of mechanical ventilation and provide the user with route care capability for the critically injured or ill patient.

In the last decade ultrasound (US) has become a very important diagnostic tool in many areas of medicine, including traumatology. US

is a reliable method to detect blood in the peritoneum. When a modern system and a skilled examiner are available the invasive diagnostic abdominal tap has become obsolete. Also hemothorax and hemopericard are easily diagnosed with US and diagnostic or evacuating puncture can safely be performed under US guidance. US can also evaluate organ damage, in particular of peripheral anatomical structures. It may guide interventional procedures and is very helpful in the detection of foreign bodies, not visible on conventional radiographs. For these reasons 21 portable US systems were purchased by the Netherlands armed forces in 1993, intended for use- next to X-ray equipment - in field hospitals with operating room facilities. Practical experience with the US systems was obtained during two years of "peacekeeping" activities in former Yugoslavia. Due to modern technology a further reduction in size with development of one hand hold systems with good imaging qualities will soon be realised. This allows US examination of injured patients on the battlefields. In case of many victims and limited capacities US may play an important role in triage.

This paper describes work undertaken at Wilford Hall Medical Center for testing and quantification of practice changes planned to facilitate the concept of "forward resuscitative surgery." This paper will begin by discussing the rationale for and composition of the Mobile Field Surgical Team (MFST). It will then proceed to discuss the challenges that arose in the formation of the team and its concepts of operation, with a description of several areas in which we have performed objective testing of the proposed new practices. I will describe our evaluation of the following areas: (1) instrument disinfection technique that does not use an autoclave; (2) live surgery using a pared-down equipment package; (3) trauma surgery without visible light; and (4) possible application of thermal imaging to commonplace medical care

TEMPORARY ARTERIAL SHUNTS FOR MANAGEMENT OF MAJOR EXTREMITY ARTERIAL INJURY: A FIELD EXPEDIENT BRIDGE TO DEFINITIVE SURGICAL RECONSTRUCTION

Dawson, David L., Air Force Medical Center, USA; Light, Jerry T., Air Force Medical Center, USA; Putnam, A. Tyler, Air Force Medical Center, USA; Kissinger, David P., Air Force Medical Center, USA; Bradley, Donald V., Air Force Medical Center, USA; September 1998; 8p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Shunts were successfully placed and patency maintained 24 hours in all 8 animals. Shunt malposition with subsequent thrombosis requiring thrombectomy and repositioning occurred in one pig during the 4th hour of the experiment; this was successfully corrected and the shunt remained patent throughout the remainder of the experiment. Flow data from two animals was not able to be analyzed-one developed malignant hyperthermia which caused a hyperdynamic state, skewing the data; and the second had incomplete flow data due to equipment malfunction. This graph depicts the flow data comparing he control and shunted limbs. Although the flow through the shunted limbs was significantly lower than that of the non-shunted ones ($p = 0.0015$), the shunted limbs remained warm and well-perfused without any clinical evidence of ischemia. Flow rates did not differ significantly over time in either the shunted or control limbs.

BLOOD SUBSTITUTES IN CONTINGENCY OPERATIONS

Magnin, Anthony A., Hemosol, Inc., Canada; Carmichael, F. J. Lou, Hemosol, Inc., Canada; September 1998; 8p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

For many years there has been a concerted effort by both industry and the military to develop blood substitutes. Such products are expected to be well-suited for use in emergency/trauma settings where the timely provision of fully cross-matched blood for resuscitation and/or transfusion may be difficult and prohibitively expensive. The use of cell free hemoglobin solutions as a safe and effective adjunct or alternative to red blood cell transfusion has long intrigued and challenged medical practitioners dealing with the various aspects of trauma, elective and emergency surgery, and other branches of medicine. Interest in this field has been heightened by concerns of the safety of blood and blood products, particularly in terms of possible contamination with infectious agents. There are still concerns about transmission of blood-borne diseases during the "window period" when infectious agents may be present, but antibodies are not yet detectable in blood using current methods. In addition, the incidence of immune suppression, occasional accidental mismatching of blood and recipient, and the extent of both major and minor reactions associated with blood transfusion continue to cause concern.

A WORLDWIDE EPIDEMIOLOGICAL SURVEY ON THE INFRA-STRUCTURE FOR PREVENTION OF COMMUNICABLE DISEASES IN THE MILITARY

dAmelio, R., Ministry of Defence, Italy; Heymann, D. L., World Health Organization, Switzerland; September 1998; 6p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Infectious diseases represent a heavy burden for mankind. In 1995 infectious diseases were responsible for more than 17 million (33%) of nearly 52 million deaths worldwide. Among these infectious diseases, 65% were those characterized by person-to-person transmission, such as the sexually and air-borne transmitted diseases, followed by food, water and soil-borne (22%), insect-borne (13%) and animal-borne (0.3%) diseases. They include, in order of importance, acute respiratory infections (4.4 million deaths/year), followed by diarrhoeal diseases (3.1 million deaths/year), tuberculosis (3.1 million deaths/year) malaria (2.1 million deaths/year), hepatitis B (1.1 million deaths/year), HIV/AIDS (greater than 1 million deaths/year), neonatal tetanus (500,000 deaths/year), whooping cough (355,000 deaths/year) and lastly roundworm and hookworm (165,000 deaths/year)

PREVENTION OF HIV INFECTION AND SEXUALLY-TRANSMITTED DISEASES IN CONTINGENCY AND PEACEKEEPING OPERATIONS

Kingma, Stuart J., Joint United Nations Programme on HIV/AIDS, Switzerland; September 1998; 6p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Armed forces personnel are at special risk for exposure to STDs and HIV. The HIV risks are related to sexual activity and injecting drug use, and they are much higher during deployment. Military readiness can be compromised by these diseases through sick leave, loss of training input, loss of experience/skills, and cost of replacement training. HIV-positive personnel jeopardise field safety of blood supplies during contingency operations. Providing first aid in the field is also more complicated, and interaction with the local population carries its special risks.

PRIORITIES IN IMMUNIZATIONS FOR PEACEKEEPING FORCES
 Steffen, Robert, Zurich Univ., Switzerland; September 1998; 8p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Previous experience shows wide differences in the immunizations status among contingents arriving from different nations for peacekeeping missions. This seems to be due to lack of knowledge, lack of coordination, and lack of financial support. To obtain logical priorities for immunizations in peacekeeping forces, one must primarily assess the risk of infection, to a lesser degree consider the impact of infection. Host factors, legal aspects and vaccine safety and efficacy also play a role. Usually, peacekeeping missions take place in regions with impaired hygienic conditions, in non-immunes, the risk is greatest for hepatitis A, hepatitis B, typhoid fever and measles in most countries. Yellow fever, Japanese encephalitis, poliomyelitis, and plague are of no concern at many destinations, but the risk may be substantial at others. Cholera, diphtheria, rabies, tetanus and tuberculosis are a lesser, albeit almost worldwide risk for troops. Depending on the type of mission, immunization against influenza needs to be considered. Future oral vaccines against gastrointestinal infections may become relevant issues in the near future.

The results of this study also indirectly suggest that reducing exposure in-country is a very important factor. If keeping personnel indoors can be accomplished, mosquito bite exposure, especially during evening hours when they are most active in feeding, would be beneficial. If sleeping indoors is accomplished with the issuance and proper use of mosquito netting.

AIR EVACUATION UNDER HIGH-LEVEL BIOSAFETY CONTAINMENT: THE AEROMEDICAL ISOLATION TEAM

Christopher, George W., Army Medical Research Inst. of Infectious Diseases, USA; Eitzen, Edward M., Jr., Army Medical Research Inst. of Infectious Diseases, USA; September 1998; 10p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Contingency operations in tropical environments and the potential use of biological weapons by adversaries place troops at risk for potentially lethal contagious infections. Examples include viral hemorrhagic fevers, plague, and zoonotic poxviruses. Rapid diagnosis and basic research regarding countermeasures for such illnesses would be facilitated by evacuating a limited number of patients to a facility with containment laboratories. In order to safely evacuate such patients to our institute via military aircraft and to minimize the risk of transmission to air crews, care givers, and civilian communities, the U.S. Army Medical Research Institute of Infectious Diseases has developed an Aeromedical Isolation Team (AIT). The AIT is a rapid response team with worldwide airlift capability designed to evacuate and manage patients under high level containment. Teams consist of a physician, a registered nurse, and four to six medics. The teams are accompanied by a fully functioning diagnostic laboratory utilizing genetic typing methods and immunoassays. Protective equipment includes impermeable protective suits equipped with powered HEPA-

filtered respirators and patient isolators equipped with negative-air pressure, HEPA-filtered ventilation system. Technical aspects of AIT equipment, training, deployments, and capabilities are discussed.

USA military services deploy to isolated locations with integral medical support. In most small deployments the unit has a General Medical Officer and/or a Physician's Assistant as well as a complement of Medics to provide primary medical care to the assigned personnel. The goal of telemedicine is increase the quality of care given to the soldiers by providing access to specialty providers utilizing satellite communications and commercial off the shelf technologies.

Recent advances have allowed us to expand the realm of intensive care medicine into the aeromedical evacuation arena. The rate limiting step to the full scale development of this concept is sufficient numbers readiness directed numbers would not be gainfully employed during a peace time environment. Therefore, we must look to alternate personnel sources to provide this care with sophisticated medical backup. In this regard, telemedicine provides an excellent vehicle to leverage the sophisticated medical care into the hands of other health-

care providers with intensivists backup. Air to ground telemedicine may expand the functionality of available non-physical providers during military medical contingency operations.

Advanced imaging and telecommunications capabilities are becoming commonplace in major university hospitals. The availability of such services to people in remote or deployment environments is not always certain. To address this issue, the US Army and Battelle Memorial Institute developed a family of telemedicine workstations. One device, the MUSTPAC (Medical UltraSound, Three-dimensional and Portable with Advanced Communications) was deployed to the 212th Mobile Army Surgical Hospital in Tuzla, Bosnia-Herzegovina in a feasibility study investigating its potential as a remote diagnostic tool.

STATRAD: A PORTABLE IMAGING CENTER FOR REMOTE/ HOSTILE ENVIRONMENTS

Freckleton, M. W., Air Force Medical Center, USA; Johnson, Thomas G., Army Medical Research and Materiel Command, USA; September 1998; 4p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A01, Hardcopy; A04, Microfiche

Until very recently, radiological imaging centers have been restricted to large medical institutions within large, fixed facilities. Although there is no diminution in the need for factors including equipment size, weight, power/water supply, narrow temperature thresholds, etc., have precluded all but the most rudimentary radiological imaging in austere locations. StatRad is an ongoing effort to develop not only imaging equipment, but the components of an integrated and scaleable imaging center for use in circumstances which cannot be controlled for environmental factors, and where the medical response must be rapid and decisive.

A CONCEPTUAL APPROACH TO THE STUDY OF STRESS IN PEACEKEEPING PERSONNEL

Murphy, P. J., National Defence Headquarters, Canada; Farley, K. M. J., National Defence Headquarters, Canada; Dobrev-Martinova, T., National Defence Headquarters, Canada; September 1998; 3p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A01, Hardcopy; A04, Microfiche

This paper outlines the current conceptual model utilized in Canadian Forces psychological research of the stress of peace operations. The model incorporates stressor, moderator, outcome and intervention components at the individual, group and organizational levels. Previous research has illustrated many of the various sources of stress on peace operations. Individual and organizational level resources that could serve as moderators of operational stress include individual coping skills, satisfiers of the peacekeeping experience, perceived organizational support and unit climate. Outcome measures include signs and symptoms of stress: both commonplace and more serious stress reactions. Other outcome and intervention components will be explored in future research. This theoretical framework should aid our understanding of the human dynamics of the deployment cycle and suggest appropriate training and interventions to enhance individual and organizational well-being and performance.

STRESS IN PEACE SUPPORT OPERATIONS: RECENT CANADIAN EXPERIENCES

Murphy, P. J., National Defence Headquarters, Canada; Farley, K. M. J., National Defence Headquarters, Canada; Dubrev-Martinova, T., National Defence Headquarters, Canada; Gingras, C., National Defence Headquarters, Canada; September 1998; 4p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A01, Hardcopy; A04, Microfiche

The Canadian Forces continues its high profile involvement in peace operations in various parts of the world. At present, over 2000 Canadian Forces personnel are deployed overseas in the peace support roles, largely in Bosnia and Haiti. A long-term research project into the human dimension of operational performance has monitored several aspects of deployments. The paper addresses research findings relating to the stress of peace support operations and other

human factors. Select details of significant stressors, the stress-strain relationship and several moderating factors (satisfiers, group cohesion, coping styles and perceptions of organizational support) are presented.

SELECTION AND SPECIAL PHYSIOLOGICAL TRAINING OF FLYING PERSONNEL TO HIGH +G(Z)-MANEUVERABLE FLIGHTS-MAIN CONCEPT

Stupakov, G. P., Air Force Inst. of Aviation and Space Medicine, Russia; Khomenko, M. N., Air Force Inst. of Aviation and Space Medicine, Russia; AGARD, Current Concepts on G-Protection Research and Development; May 1, 1995, 15 p; In English; See also 19950027629; Copyright; Avail: CASI; A03, Hardcopy; A02, Microfiche

For insurance of the complete and efficient protection of flyers from exposure of high-sustained and rapid onset rate +Gz-acceleration profiles, together with administration of modern sophisticated counter-G technical appliances, individual physiological tolerance of flyer to the effects of high level Gz stress plays an important role. The necessity of practical implementation of methods of determination of Gz acceleration tolerance to high-sustained +Gz-stress for selection are verified, along with carrying-out of special physiological preparation of flyers in order to magnify their tolerance to such effects. The results of study are presented of health and special physiological preparedness on pilot's individual tolerance to high-sustained +Gz-accelerations. The procedure and criteria of determination of pilot's ability to tolerate high level +Gz-accelerations in centrifuge tests for selection to transition and mastering the high performance fighter-aircraft of type MIG-29 and SU-27 are disclosed. The possibility of individual pilot's tolerance to high sustained +Gz-acceleration prediction is proved, based on data of statoergometric functional loading test on special physical trainer 'Statoergometer'. For enhancement of flyers' tolerance to high-sustained +Gz-acceleration the complex of means and ways of special physiological preparation involves carrying-out of ground and simulator training, course of physical training exercises on special trainers, realization of training centrifugation runs, and special in-flight training in aerobatic sorties. The methodological particularities of carrying-out and efficiency of various kinds of above mentioned special preparation of flyer are analyzed and the probable prospective ways of its further improvement are discussed.

SELECTION AND TRAINING OF MIG-29 AND FUTURE FIGHTER PILOTS

Welsch, H., German Air Force, Germany; AGARD, Current Concepts

on G-Protection Research and Development; May 1, 1995, 10 p; In English; See also 19950027629; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

With the reunification on 3 Oct. 1990 the German Air Force took possession not only of 24 MiG-29 modern fighter aircraft, but also of the human centrifuge at Koenigsbrueck near Dresden, Saxony. Until now the MiG-29 is the only high performance fighter aircraft of the German Air Force whose pilots need training in a human centrifuge in accordance with the STANAG 3827. The Office of the Surgeon General GAF took the occasion to generate a new basic program for the German Air Force (GAF) not only for the few pilots of the MiG-29, but for the future fighter pilot generation. The program includes the preselection of young pilot candidates on a voluntary basis to exclude candidates without normal physiological cardiovascular reflexes against acceleration forces, the training of student pilots of fighter aircraft before starting fighter pilot school, and the training and qualification program for fighter pilots, for flying the MiG-29 fighter aircraft or other high performance aircraft such as F-16, F-18, and Mirage 2000 as exchange pilots in the USAF, the CAF, or in France.

These proceedings include the Technical Evaluation Report, two keynote addresses and 25 papers from the Symposium sponsored by the Aerospace Medical Panel and held in Brussels, Belgium 24-27 April 1995. Situational Awareness is seen as key to mission success and aircraft safety. There are several questions that the Symposium addressed: how effectively Situation Awareness can be measured, whether it is possible to select for it and whether training strategies can improve it. The Symposium also examined the research carried out into the contribution of new Cockpit Technologies to enhance it. Loss of Situation Awareness has been the predominant cause of fatal accidents in both military and civil aviation and several examples were cited where the aircraft had been lost or put in jeopardy due to pilot error. These proceedings will be of interest to those involved in cockpit system design, human performance, human perception, cognition and accident investigation.

LOSS OF AVIATION SITUATIONAL AWARENESS IN THE CANADIAN FORCES

Cheung, Bod, Defence and Civil Inst. of Environmental Medicine, Canada; Money, Ken, Defence and Civil Inst. of Environmental Medicine, Canada; Sarkar, Paul, Defence and Civil Inst. of Environmental Medicine, Canada; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 1-1 - 1-8; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The ability of a pilot to maintain situation awareness has been recognized as crucial to mission success for some time. Situation awareness has been used to refer narrowly to a combination of tactical awareness and spatial orientation. However, situation awareness is the accurate perception and comprehension of a number of factors and conditions that could affect the aircraft and the air crew within a period of time. The present study concentrates on accidents and incidents in which there was a loss of situation awareness excluding spatial disorientation. Each accident and incident were systematically reviewed to assess the role of situation awareness. Loss of situation awareness has been implicated in many close calls and accidents. A total of 64 mishaps between 1982-1993 were found to be related to

loss of situation awareness in the Canadian Forces (CF) and it appeared throughout all mission and aircraft types. A focused and structured training program in managing cockpit resources and in maintaining attention would assist air crew in identifying conditions where situation awareness could potentially be lost and where appropriate strategies could be used to avoid the loss or to deal with the loss. Such training could be implemented through real-time man-in-the-loop flight simulator training of pilots in various flight scenarios. Similar training could also improve the performance and efficiency of air traffic controllers.

LOSS OF AVIATION SITUATIONAL AWARENESS CAUSED BY A BIRD-AIRCRAFT COLLISION

Garcia-Alcon, Jose L., Spanish Air Force, Spain; Moreno-Vazquez, Juan M., Spanish Air Force, Spain; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 2-1 - 2-3; In English; See also 19960023107; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

The history of aerial combat shows that tactical mission effectiveness depends on a few of the superior fighter-attack pilots. These few superior pilots appear to possess a heightened situational awareness that is decisive in the complex and highly fluid air combat environment. Pilot situational awareness is not a well understood concept. Most attempts at understanding situation awareness have relied almost exclusively on subjective reports, and have not led to a clear understanding of the concept. One approach to lending structure to defining situational awareness measures is to decide the information elements the pilot uses to develop an adequate 'state of knowing' concerning specific tasks, and to optimize the mission performance. Operational requirements for situational awareness have implications for flight safety and combat effectiveness. After a series of interviews with air combat experts, some authors developed a taxonomy of skills, traits and performance measures important for air-to-air combat which included aggressiveness, decisiveness, hands-on flying skills, knowledge, ability and situational awareness. This last concept was described as 'probably the sum of many perceptual and cognitive skills'. In 1984, loss of situational awareness was cited as a probable contributory factor in twenty out of forty one USAF operator-factor accident review. and loss of situational awareness is related to and a potential contributor to spatial disorientation. However, situational awareness is intended to be a more wide term encompassing more than spatial disorientation references and include more clearly psychological aspects of attention and cognition as well as sensory physiology considerations. In addition, future combat aircraft should be capable of flying anywhere, anytime and to engage air-to-air or air-to-ground attacks against a very unfavorable ratio of enemy forces. It is a clear consequence that the pilot's role will ever more turning to supervisory control, handling engines and the managing short term tactical decisions. In this way, and because the airplanes are of comparable technology in various countries, the quality of situational awareness will probably explain the pilot's variation of performance. Here we report a case in which the loss of situational awareness was the secondary consequence of an incident, and was on the point of provoking a fatal accident itself.

DETERMINANTS OF SITUATIONAL AWARENESS IN US AIR FORCE F-15 PILOTS

Carretta, Thomas R., Armstrong Lab., USA; Ree, Malcolm James, Armstrong Lab., USA; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 3-1 - 3-10; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Situational awareness (SA) is often cited as essential in pilot performance in both military and civil aviation. A study was conducted to investigate whether SA in U.S. Air Force (USAF) F-15 pilots could be predicted using the constructs of general cognitive ability, psychomotor ability, personality, and previous job (i.e., flying) experience. These constructs were chosen because they have demonstrated validity for the prediction of performance in a wide variety of military and civilian jobs, including pilots. The participants were 171 active duty

F-15 A/C pilots. Test scores, flying experience data, and supervisor and peer ratings of SA were collected at the pilots' duty locations. The first unrotated principal component extracted from the supervisor and peer ratings accounted for 92.5 percent of the variability of the ratings, which indicated substantial agreement between supervisors and peers. The unrotated first principal component was used as the measure of job performance (i.e., SA). Flying experience as measured by number of hours in the F-15 was the best predictor of SA. After controlling for the effects of F-15 experience, the measure of general cognitive ability based in divided attention, spatial reasoning, and working memory was predictive of SA. Psychomotor and personality measures did not add to the predictiveness of general cognitive ability. With additional F-15 flying experience, it is expected that pilots would improve their SA ratings. Implications for pilot selection and follow-on research are discussed.

NEAR-THRESHOLD VISUAL PERCEPTION AND MANUAL ATTITUDE TRACKING: DUAL-TASK PERFORMANCE AND IMPLICATIONS FOR SITUATIONAL AWARENESS

Beer, Jeremy M. A., Systems Research Labs., Inc., USA; Gallaway, Robert A., Systems Research Labs., Inc., USA; Previc, Fred H., Armstrong Lab., USA; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 4-1 - 4-11; In English; See also 19960023107; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

This study tested viewers' near-threshold recognition throughout the visual field, examined the effect of this task on a concurrent tracking task, and tested whether individuals' performance on each cockpit task would predict dual-task performance. An underlying assumption was that efficient multitasking supports SA. Experiment 1 measured recognition duration thresholds at different non-foveal locations. Subjects classified briefly-presented aircraft as fighters or non-fighters. An adaptive procedure adjusted viewing duration to reach 75% performance. Critical tracking ability was assessed also, using a central attitude display. Recognition deteriorated with eccentricity, and a wide distribution of threshold recognition and tracking abilities was found. Experiment 2 combined the two tasks; instructions emphasized recognition as primary. Measures included decrease in recognition accuracy, change in response latency, and increase in tracking RMS in dual-task conditions. Thresholds from Experiment 1 predicted dual-task recognition (viewers requiring longer durations classified fewer aircraft correctly), but not the increase in tracking error. Under dual-task stress, viewers with low recognition thresholds were less likely to abandon that primary task early in favor of tracking. Notably, critical tracking ability was linked to success preserving aircraft recognition: Viewers who tolerated higher instability before crashing suffered less in dual-task recognition. Field biases were identified in near-threshold performance under workload; this parallels visual search findings and is consistent with a spatially biased attention system. Findings are potentially relevant to SA assessment/selection and to the design of cockpit displays.

DEVELOPMENT OF TECHNIQUES TO IDENTIFY INDIVIDUALS WITH SUPERIOR POTENTIAL FOR SITUATIONAL AWARENESS

King, R. E., Armstrong Lab., USA; Flynn, C. F., Armstrong Lab., USA; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 5-1 - 5-6; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Certain cognitive abilities and personality traits may be conducive to the development of situational awareness. The USA Air Force Neuropsychiatrically Enhanced Flight Screening (N-EFS) program screens pilot candidates before they enter undergraduate pilot training (UPT). The Multidimensional Aptitude Battery (MAB), a highly timed IQ test, and CogScreen, a computer-based cognitive test, are now administered to all UPT candidates. CogScreen measures attention, memory, visual scanning, response speed, visual-spatial orientation,

capacity for divided attention, and resistance to response interference. CogScreen approximates and measures response to the multiple, competing activities requiring prompt and prioritized attention. Traditional neuropsychological tests do not gauge the subtle abilities that performance in a high-demand environment requires on account of their clinical, rather than occupational, emphasis. The Personal Characteristics Inventory (PCI) and the Revised NEO-Personality Inventory (NEO-PI-R) comprise the optional (requiring participant informed consent) portion of NEFS. PCI measures decision-making strategies and interpersonal style, gauging potential for effective crew resource management. The NEO-PI-R may suggest optimal personality styles for developing situational awareness in particular aircraft. Preliminary results suggest that prospective pilots have a wide range of intelligence and cognitive ability (from average to very superior) and distinct personality styles. Testing results captured prior to the commencement of training will be compared to occupational outcome (whether or not the candidate became a mission-ready pilot) to assess their predictive value in the development of situational awareness.

SITUATIONAL AWARENESS, TRUST, AND COMPATIBILITY: USING COGNITIVE MAPPING TECHNIQUES TO INVESTIGATE THE RELATIONSHIPS BETWEEN IMPORTANT COGNITIVE SYSTEMS VARIABLES

Taylor, R. M., Defence Research Agency, Farnborough, UK; Shadrake, R., Defence Research Agency, Farnborough, UK; Haugh, J., Defence Research Agency, Farnborough, UK; Bunting, A., Defence Research Agency, Farnborough, UK; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 6-1 - 6-14; In English; See also 19960023107; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Situational awareness (SA), trust, and compatibility are considered as variables associated with cognitive systems. Three studies are reported investigating the relationships between these variables using experimental methods, subjective ratings, and cognitive mapping techniques. In the first study, a computer simulation of an Air Traffic Control (ATC) task was used to investigate the relationship between task performance and subjective estimates of situational awareness using the Situational Awareness Rating Technique (SART). The results show a strong association between rated SA and performance, and provide evidence of the predictive power of a unitary SART index. In the second study, a simulated aircraft task environment was used to investigate the effects of unreliable computer aiding on task performance, and ratings of SA, and of attitudes associated with trust in task automation. The results show evidence of performance compensation without awareness of automation failure. Trust was associated with attitudes to computer performance; task performance was associated with ratings of understanding. In the third study, a task requiring directional responses to a multi-modal display of situational information was used to elicit personal constructs associated with the cognitive compatibility (CC) of the task. Constructs were elicited using the Repertory Grid procedure. Analysis of subjective ratings of the construct dimensions indicate the multi-dimensional structure of the constructs associated with CC namely: ease or difficulty of reasoning and understanding; depth of processing or stimulus-response compatibility; learning, and experience or schema compatibility. The development of tools for the subjective measurement and prediction of SA and cognitive compatibility is discussed.

SITUATIONAL AWARENESS MEASUREMENT IN COCKPIT EVALUATION TRIALS

McGuinness, Barry, British Aerospace Aircraft Group, UK; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 7-1 - 7-8; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Maintaining good situational awareness has always been a necessary task for pilots. However, the influx of more and more new

technological capabilities in aircraft systems and the growing demands made by these on the pilot's attention has highlighted the vulnerability of situational awareness and its critical effects on pilot performance and mission success. In developing and evaluating novel displays and other new cockpit systems, measuring any differences in the pilot's situational awareness as well as performance has become a growing priority. We therefore require suitable tools for effective situational awareness measurement in simulation research rigs. This paper presents several insights into measuring situational awareness in cockpit systems research, and discusses in detail the rationale for a proposed test-battery approach that incorporates a variety of measurement techniques.

DEVELOPMENT OF CRITERION MEASURES OF SITUATION AWARENESS FOR USE IN OPERATIONAL FIGHTER SQUADRONS

Waag, Wayne L., Armstrong Lab., USA; Houck, Michael R., Dayton Univ. Research Inst., USA; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 8-1 - 8-8; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper describes the development of three Situation Awareness Rating Scales (SARS) that were used to measure pilot performance in an operational fighter environment. These instruments rated situation awareness (SA) from three perspectives: supervisors, peers, and self-report. SARS data were gathered from 239 mission-ready USAF F-15C pilots from 11 operational squadrons. Reliabilities of the SARS were quite high as measured by their internal consistency (.97 to .99) and inter-rater agreement (.84). Correlations between the supervisory and peer SARS were strongly positive (.85 to .87), while correlations with the self-report SARS were positive, but smaller (.50 to .58). A composite SA score was developed from the supervisory and peer SARS using a principal components analysis. The resulting score was found to be highly related to previous flight experience and current flight qualification. A prediction equation derived from available background and experience factors accounted for 73% of its variance. Implications for use of the composite SA score as a criterion measure are discussed.

SITUATION AWARENESS: IMPACT OF AUTOMATION AND DISPLAY TECHNOLOGY

Wickens, Christopher D., Illinois Univ. at Urbana-Champaign, USA; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, K2-1 - K2-13; In English; See also 19960023107; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

In this paper we first offer two compatible definitions of situation awareness, present an information processing model of how it is maintained and lost, and discuss different techniques by which it is measured. Causes for the loss of situation awareness related to low visibility, dense airspace, free flight, and automation are briefly described, and then problems related to automation-induced situation awareness loss with the flight management system are discussed in detail. These problems are related to a poor mental model, high system complexity, removal of the pilot from the control loop, and inadequate displays. The next section of the paper focuses on display technology that has been used to support situation awareness of aviation hazards (traffic, weather, terrain). We discuss research issues related to electronic map scale, rotation, and dimensionality as these influence flight path guidance and hazard awareness. It is concluded that the more egocentric levels of these dimensions that do the best job of supporting flight guidance do not necessarily support situation awareness. The final section briefly discusses the less well researched area of task awareness.

19960023119 Mooij and Associates, Oegstgeest, Netherlands
POINT-OF-GAZE MEASUREMENT IN AVIATION RESEARCH
Mooij, H. A., Mooij and Associates, Netherlands; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 12-1 - 12-9; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Traditional assessment methods (performance and subjective) may not be sufficient for the evaluation of man-machine systems, in which an appropriate level of situation awareness of the operator is of crucial importance. Eye Point-Of-Gaze (POG) and eye-blink measurement is one of the psychophysiological methods which may be helpful, as it can be continuously available without being intrusive to the operator's task. Eye point of gaze can provide data about where in the environment information is sought, as well as about the pattern of eye-scanning as evidenced in different situations. After a feasibility study, subsidised by the Netherlands' Agency for Aerospace Programmes (NIVR) in 1990, the European Space Agency (ESA) contracted Mooij & Associates in mid-1991 to develop a system capable of determining point of gaze in real time in digital form, for the evaluation of competing designs of user interfaces for controlling life-support systems as well as scientific experiments on board future space craft. The system was developed over a period of three years. A successful pilot experiment on a Graphical User Interface, also performed under ESA contract, concluded the initial development of the system at the end of 1993. The commercial version of the system is called Observer. The application of eye point-of-gaze data in aviation research will be set out in this report, followed by a description of the Observer system. In conclusion, an overview of Observer usage in two simulator programs is given.

SPEECH CHARACTERISTICS OF SITUATIONAL AWARENESS IN THE COURSE OF COPING WITH IN-FLIGHT EMERGENCIES

Sulc, J., Institute of Aviation Medicine, Czechoslovakia; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 13-1 - 13-11; In English; See also 19960023107; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

A pilot, posed with an in-flight emergency works often under considerable pressure of strong emotions, resulting from an imperative threat to life. They can either destroy the situational awareness or leave it unaffected. Sonographic analysis allows to distinguish the emotional strain from behavioral breakdown with sufficient exactitude. While the information on emotional activation is mediated through the pitch variations, its impact on behaviour can be deduced from the temporal course of utterances. A relatively reliable sign of the loss of situational awareness in life threatening situations is represented by the s.c. 'open scissors phenomenon', formed by an antagonistic movement of the pitch in relation to the speech rate. Its essence resides in the uncontrollable effect of asthenic emotions, leading to the enhancement of muscular stiffness, which increases the pitch and retards the speech rate. External appearance of disadaptation to the emotionally demanding situation conceivably correlates with the impaired quality of perceptual and cognitive processes, forming a basis for the in-flight situational awareness.

ENHANCING SPATIAL SITUATION AWARENESS IN HELMET MOUNTED DISPLAYS: AN APPROACH OF INTEREST AND LIMITATIONS THROUGH EXPERIMENTAL RESULTS VISEUR DE CASQUE ET AMELIORATION DE LA PERCEPTION DE LA SITUATION SPATIALE: APPROACHE EXPERIMENTALE DE L'INTERET ET DES LIMITATIONS

Leger, A., Sextant Avionique, France; Cursolle, J. P., Sextant Avionique, France; Leppert, F., Sextant Avionique, France; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 14-1 - 14-8; In French; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Maintaining spatial situation awareness in modern fighter aircraft is generally considered as a challenging issue. In regards of recent progress made in HUDs (Head Up Displays) formats, HMDs (Head Mounted Displays) format requirements appear far from being clearly

established. Encouraging results obtained by Osgood pointed out the potential interest of offboresight symbology for low level flying and ground attack missions. Such symbology could be of considerable interest to enhance in HMDs the usually poor quality imagery (I(sup 2), IR) used during night attack mission. A binocular night attack HMD has been developed by SEXTANT on an exploratory development launched by the French DGA in 1991. Part of this development was devoted to definition and implementation of a set of symbology to be used in conjunction with imagery during flight tests on a Mirage 2000 test-bed Aircraft at the Flight Test Center(Bretigny sur Orge). To achieve this goal, an experiment was carried out using the equipment developed for the flight tests. In a first experiment, short operational scenarios including low level navigation through mountains, runway attack and ground threats escape maneuvers were flown by experienced test and military pilots. Symbology and imagery were generated by a Silicon graphics 'Onyx' graphic workstation. Symbolic and sensor imagery presentations were slaved to head movement and the pilot was fully in control of aircraft maneuvers. A virtual immersion technique was used to compare conformal and non-conformal formats (attitude and trajectory). Results showed that most pilots recognized the potential interest of conformal symbology, but also that the format used ('bird cage') was too disorienting to be really useful. Though nonconformal symbology was seen as a rupture in the logic of presentation between HUD and HMD, it was also felt that, provided some improvements were made, it remained the most readily acceptable format.

Situation awareness is a key psychological concept improving safety and performance in aircrafts. However, for a long time, any definition was commonly accepted. Now, works in cognitive psychology and ergonomics allow to propose new ways to describe features of situation awareness. Time pressure, risk taking, level of understanding, representation adjustment and anticipation are the elements in order to build dynamical models of situation awareness. These news aspects of situation awareness allow to identify different ergonomic recommendations to drive future interface design and to enhance situation awareness in combat aircrafts.

Situational awareness (SA) refers to a pilot's cognitive understanding of the mission situation. SA is complex and difficult to define because it involves a wide variety of cognitive processes. However, the present research hypothesized that one cognitive process, attentional control, would be key to understanding and enhancing pilot SA. To test this hypothesis a training procedure that was expected to improve an individual's attentional control was performed by one experimental group. Another group performed a placebo training procedure. Both groups received their training embedded within a larger program of performing complex air combat simulation missions.

Performance and SA of the groups was measured both before and after the attentional control or placebo training. As expected, the group that received the attentional control training showed a greater improvement in performance than did the placebo control group. However, although the SA metrics appeared to be sensitive to an SA manipulation within the simulation, there did not appear to be any SA benefit associated with the attentional control training.

Situational awareness is the term used to describe the crew or pilot's awareness of operational conditions and contingencies and it has been implicated as a contributory factor in incidents and accidents in the air. Analysis of incidents reveals that pilots often fail to perceive a problem existed or that the significance of the cues with respect to the safety of the flight was overlooked. Presenting information in a suitable way can increase the probability that a specific event is noticed by the pilot. The method of presentation, however, can not ensure that the knowledge of the event is maintained or that its significance in situational terms is recognised. This paper examines evidence from the literature on vigilance tasks (sustained attention tasks) and dual task experiments which indicates that limits of short term memory, switching attention or time taken to access long-term memory can exacerbate the problem of maintaining situational awareness. Evidence from two experiments are discussed which indicate that the bottleneck for processing information in complex tasks may be related to attention switching and limits on short term (working memory).

This paper presents the findings of a research investigation that explored the use of networked multiship simulation as a tool for measuring and training situation awareness (SA). The Division's research simulation facility was used which permitted two F-15s to fly against a suite of manned and unmanned adversaries in a realistic combat environment. Controller support was provided using a long-haul network linked to an AWACS simulation located at Brooks AFB, TX. A week-long evaluation syllabus was designed consisting of 9 sorties with 4 engagements per sortie. A building block approach was taken so that scenarios increased in difficulty over the week. Sixty-three mission ready F-15 pilots participated in the study. Performance ratings of SA were gathered using two trained observers. Additionally, mission outcome, network communications, video recordings, and eye movement data were gathered. As expected, SA, as measured in the simulation environment, was found to be positively correlated with ratings of SA previously obtained from the pilot's home squadron. Performance in the simulation was found to improve for identical engagements flown early and late in the syllabus. Positive opinions were expressed by study participants regarding the potential value of multiship simulation for training SA skills. Areas of greatest payoff

appear to be the training of flight resource management and decision-making skills. It was concluded that multiship simulation can be an effective tool for both measuring and training SA.

SITUATION AWARENESS AND WORKLOAD: BIRDS OF A FEATHER?

Hendy, K. C., Defence and Civil Inst. of Environmental Medicine, Canada; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 21-1 - 21-7; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

In this paper it is argued that an hierarchical information processing model, with a basis in s perceptual control theory, provides the necessary r framework for interpreting a large, unfocused empirical c literature on the topics of workload and situation(al) awareness (SA). The fundamental importance of situation awareness will emerge in considering the role of the mental model in providing the reference signal for a closed loop perceptual control system. It will be asserted that those aspects of the mental model generally covered by the SA rubric result from high level information processing activity that requires spare capacity to service. Increasing time pressure (workload) reduces the capacity available for this activity. An experiment in the application of a workload scale (NASA TLX) and a situation awareness] metric (SART) to a simulated air traffic control environment is cited. It will be shown that the situation awareness scale taps largely into the workload side of the equation rather than the SA side. Implications for the measurement of SA will be drawn.

WILL THE MISSION WORKLOAD PROFILE ALLOW EFFECTIVE SITUATIONAL AWARENESS?

Jensen, S. E., Defence Research Agency, Farnborough, UK; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 22-1 - 22-5; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper describes a video-based technique, C-SAW (pronounced 'see-saw'), for developing a time- and task-ordered mission profile of workload with a resolution of as little as 3 seconds real time and much less if used freeze-frame. The rating scale can be based on any uni-dimensional rating scale and can also be used with some multi-dimensional scales. When C-SAW is based on the Bedford scale, the result gives a good indication of the 'spare' attentional capacity which can be devoted to situational awareness. A proposed extension of the C-SAW approach to provide a specifically SA mission profile, based on SWAT, is described.

NEUROLOGICAL DIMENSIONS OF SITUATIONAL AWARENESS

Firth, J. L., University Hospital, UK; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 26-1 - 26-8; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The first problem in the Situational Awareness (SA) field is that of definition. The how, why, where and whens? Above all what is SA? Neurologically, SA is defined as the accurate, comprehensive, four dimensional appreciation of a situation at any one point in time. to be operationally effective SA has to be continuously up-rated, modified and developed throughout the time course of the operational epoch. The operational epoch is the significant period of time under consideration. This can be the duration of an engagement, a flight sector, a detail, a crisis, an operation, a detachment, a campaign, an electoral session or a historical era. SA is the first of the three essential, inter-

linked and inter-dependent components of aircrew operational ability and the foundation for the other two: appropriate decision and effective action.

THE ROLE OF LINEAR ACCELERATION IN VISUAL-VESTIBULAR INTERACTIONS AND IMPLICATIONS IN AIRCRAFT OPERATIONS

Correia, Manning J., Texas Univ., USA; Luke, Brian L., Naval Aerospace Medical Research Lab., USA; McGrath, Braden J., Naval Aerospace Medical Research Lab., USA; Clark, John B., Naval Aerospace Medical Research Lab., USA; Rupert, Angus H., NASA Johnson Space Center, USA; Apr. 1996; 6p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

While considerable attention has been given to visual-vestibular interaction (VVI) during angular motion of the head as might occur during an aircraft spin, much less attention has been given to VVI during linear motion of the head. Such interaction might occur, for example, while viewing a stationary or moving display during vertical take-off and landing operations Research into linear VVI, particularly during prolonged periods of linear acceleration, has been hampered by the unavailability of a programmable translator capable of large excursions We collaborated with Otis Elevator Co. and used their research tower and elevator, whose motion could be digitally programmed, to vertically translate human subjects over a distance of 92.3 meters with a peak linear acceleration of 2 meters/sec(exp 2) During pulsatile or sinusoidal translation, the subjects viewed moving stripes (optokinetic stimulus) or a fixed point source (light emitting diode, led, display), respectively and it was generally found that. The direction of linear acceleration relative to the cardinal head axes and the direction of the slow component of optokinetic nystagmus (OKN) determined the extent of VVI during concomitant stripe motion and linear acceleration. Acceleration along the z head axis (A(sub z)) produced the largest VVI, particularly when the slow component of OKN was in the same direction as eye movements produced by the linear acceleration and Eye movements produced by linear acceleration are suppressed by viewing a fixed target at frequencies below 10 Hz But, above this frequency the suppression produced by VVI is removed. Finally, as demonstrated in non-human primates, vergence of the eyes appears to modulate the vertical eye movement response to linear acceleration in humans.

SPATIAL VISUO-MOTOR COMPATIBILITY IN A TRACKING TASK

Cavonius, C. R., Dortmund Univ., Germany; Ehrenstein, W. H., Dortmund Univ., Germany; Lewke, E., Dortmund Univ., Germany; Apr. 1996; 4p; In English; See also 19960053795; No Copyright; Avail: CASI; A01, Hardcopy; A03, Microfiche

Two logically-related areas of study are discussed here: stimulus-response compatibility, which has to do with whether a signal and an operator's response to it are perceptually related - for example, whether both are located in similar parts of the operator's visual field and manual tracking, in which an operator uses a control device to follow a moving signal. In our experiments, subjects moved a stylus that was constrained to move along a straight path, to track a target that also moved in a straight line. Either the stylus track or the trajectory of the target could be rotated so that they were either parallel, or so that they were at an angle to one other. Performance, measured either by time-on-target or by the RMS error between the subject's track and the desired track, was best when the target and tracking movements were parallel and in phase, or nearly so; and worst when they in, or close to, counterphase. Earlier work has shown that when both the signal and the location of the response are stationary, performance is best when their positions are compatible. The present results show that this holds for moving targets as well.

One of the most important observations that William James made is that consciousness- the awareness of information - is comprised of continuous and successive processes, that consciousness is a stream of events, and as such, the time domain of this stream must be understood. It is now clear that although the processing of information may be observed within some discrete interval of time, it necessarily depends on the previous processing of similar or identical input-memory always plays a role. Identical or similar input, to that previously experienced, does not necessarily mean that the processing of that input is similar or identical. Insofar as the brain is concerned the processing of each input includes not only the memory of previous inputs, but also those endogenous modifications imposed by the brain that are necessary for the final product, i.e., the conscious event, 'make sense', that is, to make the product consistent with the context in which it occurs, both historically and in the present. Memory is always a construction of the past, the present, and predictions of the future. Furthermore, it is now obvious that the brain of each person is an individual brain. The same brain may process the same input differently at different times, depending in part on previous experience, but also in part on its inherent capability do so - that is the inherent capability of the brain for variability - what characterises brains is not central tendency but variability.

RESPONSE LATENCIES TO AIRCRAFT DETECTION AMONG NORAD SURVEILLANCE OPERATORS

Pigeau, R. A., Defence and Civil Inst. of Environmental Medicine, Canada; Angus, R. G., Defence and Civil Inst. of Environmental Medicine, Canada; O'Neill, P., Operational Research and Analysis Establishment, Canada; Apr. 1996; 18p; In English; See also 19960053795; No Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

A function of North American Aerospace Defence (NORAD) in North Bay, Ontario is to identify all aircraft entering Canadian air space. The first step in performing this task is to detect visually the presence of aircraft from either radar or transponder information presented on display consoles. This challenging, real-world vigilance task was used in two experiments to investigate factors affecting detection latencies. Taken as a whole, the experiments revealed that 1) transponder tracks, with their unique symbology, were more easily detected than radar tracks; 2) performance varied as a function of geographic area of coverage; 3) the midnight shift was particularly sensitive to vigilance decrements; and 4) a 'vigilance decrement' effect can occur in a real world task, but this effect is not as strong as those reported in laboratory studies.

AN ANALYSIS OF STRESS AND COPING FACTORS ON AIR CREW DURING EMERGENCY MEDICAL SERVICE (EMS) HELICOPTER OPERATIONS

Fonne, V. M., Institute of Aviation Medicine, Norway; Myhre, G., Institute of Aviation Medicine, Norway; Apr. 1996; 6p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Summary: The air ambulance service represents a field of operations where the crewmembers encounter situations which demand quick decisions and immediate action and where time limitations are frequent. Missions flown include diverse tasks such as inter-hospital transportation of patients as well as search and rescue operations. The operational stresses of this kind of service are plentiful and include both physical and psychological factors. Additional stressors include mission type, weather conditions and harsh terrain. Previous studies on stress and performance indicate that risk prone situations have a tendency to increase the crew's level of activation and will ultimately influence their performance. The purpose of the current study was to see whether one can observe differences in the crewmembers' physiological activation relative to mission type, crewmember's area of responsibility and individual psychological coping strategies and use of defense mechanisms. The initial study consisted of 31 male crewmembers from the Norwegian Air Ambulance Service distributed among helicopter pilots, medical doctors and rescue men. to assess physiological activation, plasma concentrations of cortisol were measured directly after mission completion as well as 24 hours later for controlling purposes. In addition, a psychological assessment was administered for an evaluation of general anxiety levels, coping strategies and defense mechanisms as well as subjective evaluations of the mission flown.

FATIGUE: OPERATIONAL AND CLINICAL ISSUES

Porcu, S., Italian Air Force Pratica di Mare, Italy; Bellatreccia, A., Italian Air Force Pratica di Mare, Italy; Mambro, G., Italian Air Force Pratica di Mare, Italy; Napolitani, I., Italian Air Force Pratica di Mare, Italy; Apr. 1996; 8p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Despite the great number of papers existing in the literature about the issue of fatigue - both in the clinical medicine and in the human factors field - it actually remains a controversial matter. This difficulty depends on the complexity of defining, recognizing, and measuring the phenomenon of fatigue and of evaluating its effects on performance. Regarding operational contexts, fatigue may be seen as the

objective workload imposed by the task (input load), as the operator effort, or as the level of performance (work output). It is important, moreover, to divide the physical (central, peripheral-muscular) from the psychological fatigue. In general terms, physical exhaustion and performance impairments are not necessarily perceived as fatigue; psychological fatigue, instead, has a higher subjective component, a lower correlation with performance decrements, and is less dependent on the level of energy expenditure. Other distinctions may be done between acute, cumulative, and chronic fatigue. Several attempts have been made to model psychological fatigue and to explain the mechanisms involved in its generation and development. The activation theory, for instance which takes into account the level of arousal and performance considers fatigue as the result of functioning long time at an inadequate level, too high or too low, of information processing. A complex relationship actually exists among the level of arousal, objective measures of performance, the effort assessed using special probes (e.g., cognitive evoked potentials during dual task, increasing complexity tasks), and subjective fatigue. The relationship between fatigue and performance is also complicated by the many interacting variables such as individual motivation and coping capability. In air operations, finally, fatigue may be related, in a reciprocal way, to 'automated' and 'controlled' tasks, with relevant effects on flight safety. Further efforts of the aeromedical community therefore should be directed to both identify early indicators of fatigue and to detect the different types (clinical syndrome or not) of fatigue. This paper is a review of the current knowledge about operational and clinical fatigue, taking into particular account a recent clinical entity, the chronic fatigue syndrome.

SLEEPINESS DURING AN ACURATE NIGHT SHIFT: NEUROPHYSIOLOGICAL CORRELATES AND EFFECTS ON PERFORMANCE
Porcu, S., Italian Air Force Pratica di Mare, Italy; Bellatreccia, A., Italian Air Force Pratica di Mare, Italy; Casagrande, M., Italian Air Force Pratica di Mare, Italy; Ferrara, M., Italian Air Force Pratica di Mare, Italy; Tricarico, A., Italian Air Force Medical Service HQ, Italy; Apr. 1996; 8p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Nocturnal sleepiness is a common complaint suffered from night shift workers, especially in condition of abrupt shift of the wake-sleep cycle. It is evident, therefore, that monitoring the presence of sleepiness and its effects on performance is of primary importance to the aeromedical community. In this study we evaluated the effects of a laboratory simulation of acute night shift on sleepiness, vigilance and performance, using Maintenance of Wakefulness Test, Multiple Sleep Latency Test and three pencil and paper tests: Digit Symbol Substitution Test, Deux Barrage Test and Letter Cancellation Task. Results showed that the ability to maintain wakefulness and to perform visuo-attentive tasks is substantially spared during the night, despite Multiple Sleep Latency Test and performance on Letter Cancellation Task reveal, respectively, increasing sleepiness and degrading performance on more complex and monotonous task.

PROSPECTIVE AND RETROSPECTIVE TIME ESTIMATION DURING AN ACUTE NIGHT SHIFT
Dell'Erba, G., Italian Air Force Pratica di Mare, Italy; Bellatreccia, A., Italian Air Force Pratica di Mare, Italy; Tricarico, M., Italian Air Force Pratica di Mare, Italy; Porcu, S., Italian Air Force Pratica di Mare, Italy; Apr. 1996; 4p; In English; See also 19960053795; No Copyright; Avail: CASI; A01, Hardcopy; A03, Microfiche

Prospective and retrospective time perception of six healthy subjects was analysed during an acute shift of the sleep-wake rhythm. Aim of the study was to verify possible detrimental effects of time of the night and side effects of temazepam, taken during the day, on internal time processing, within a double-blind balanced study. Our findings show that retrospective and prospective time perception are not significantly influenced by time of the night or by temazepam intake.

However, there is a trend toward significance indicating that subjects underestimate time in the pure prospective condition the night following drug assumption.

Although often used in current terminology, fatigue remains a badly defined concept in scientific works. The absence of a clear definition creates limits, since fatigue has many aspects, which are related to physiological, sensory, and mental. Physical fatigue and sensory fatigue are best understood at this time and can be evaluated by instrumentation. Mental fatigue presently remains a subjective concept, suggested by analogy with physical and sensory fatigue. It is characterized by a diminution of the operator's efficiency which translates into a more important effort to maintain his performance at an equivalent level. By contrast, the mechanisms of accumulation and recuperation remain poorly explored, in spite of the recognition of their importance, especially for stating recommendations concerning the length of missions and the resting of equipment. As a beginning for data in the literature and the present understanding, a rough study model applicable to aeronautics is proposed. This model especially takes a different account of the different components, such as environmental conditions, circadian rhythm, and the nature of the task. It is able to serve in support of experiments in the laboratory and in real situations.

Many hours of work and waiting are necessary to prepare a flight operation. Sometimes, cancellation of mission and new programming can result for pilots in tiredness and drowsiness, especially some military operations as multiple, long range, carrier based, air combat missions (US A6 Intruder), maritime patrols (French Atlantics), observations (AWACS). The general schedule of this simulated sustained flight operation is: planning 1: 9 hours, rest period (without sleep): 4 hours, mission 1: 14 hours, rest period (with sleep): 6 hours, planning 2: 9 hours, rest period (without sleep): 4 hours, mission 2: 14 hours, night sleep recovery: 12 hours. To evaluate the level of vigilance and performance, questionnaires, mood scales, seven computer-administered performance tasks, a computer-administered sensitivity contrast threshold, and multiple sleep latency tests were repeatedly administered to the subjects throughout the experiment. An electroencephalogram was also recorded during rest periods. Several physiological measures (heart rate, blood pressure, core temperature) were also obtained at regular intervals. After a training period eight healthy volunteers, military men were included in this study. The results show that the effects of this kind of sleep disturbance is limited. In fact, the most sensitive tasks were the memory search task (p less than 0.05) 2 and 4 letters, the tracking task (p less than 0.05) and the double task (p less than 0.05). The sleep latencies decreased more quickly during the second period of 27 hours sleep deprivation than during the first one. The same phenomenon was observed with the items: clumsiness, drowsiness and tiredness of the analog visual scale. No significant perturbation of temperature, heart rate and blood pressure rhythms was seen. This simulated sustained flight operation shows a restricted but real perturbation of vigilance and efficiency. Recovery is observed after the diurnal nap, but it is limited in intensity and duration.

These data suggest that the nap is an interesting counter-measure for limited sleep deprivation but also that in case of repeated limited sleep deprivation or a more extensive sleep deprivation others counter-measures, like pharmacological substances, must be used.

CURRENT NEUROLOGICAL PERFORMANCE ISSUES IN ARMY ROTARY-WING OPERATIONS

Crowley, John S., Army Aeromedical Research Lab., USA; Apr. 1996; 4p; In English; See also 19960053795; No Copyright; Avail: CASI; A01, Hardcopy; A03, Microfiche

Modern rotary-wing military operations present unique challenges that demand optimal neurological performance of the aviator. Tactics unique to Army aviation can be particularly demanding, but many problems plague rotary-wing aviators in general. Helicopters classically require more attentional resources to control than do fixed wing aircraft; modern helicopters now present the aviator with complex computer systems to simultaneously master. Additionally, the living environment and flight environment inflict unique stresses on rotary-wing aviators--missions are mounted from unimproved field sites, frequently into oppressive thermal conditions that may persist throughout the mission. Nap-of-the-earth flying under night vision devices demands unerring cognitive and sensorimotor performance. Recent downsizing and changing tactics require the distant projection of force--rapid deployment of small and versatile fighting units--with the attendant hazards of sleep deprivation and circadian desynchronization. It is likely that improving the quality of information presented to the aviator would reduce workload and the number of accidents due to disorientation. These enhancements could take the form of improved night vision systems, better instrument displays, 3D audio systems, etc. However, high priority should be given to developing and fielding guidance for aircrew work/rest cycles in the combat environment. Neurological performance in the face of operational stress would be best maintained via a customized crew endurance plan that competently addresses circadian rhythms, sustained operations, and operational medications.

FATIGUE AND PERFORMANCE IN THE AIR TRAFFIC CONTROL ENVIRONMENT

DellaRocco, P. S., Federal Aviation Administration, USA; Cruz, C. E., Federal Aviation Administration, USA; Schroeder, D. J., Federal Aviation Administration, USA; Apr. 1996; 10p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Air traffic control (ATC) is a complex system in which controllers are faced with many of the human factors challenges posed to personnel in safety-related occupations. This paper focuses on the Civil Aeromedical Institute's (CAMI's) research on shift work-induced fatigue as one factor influencing controllers' performance. Many FAA controllers work relatively unique counterclockwise, rapidly rotating shift schedules. The research presented here was conducted in both laboratory and operational environments. Representative data from three studies are presented on characteristic sleep and performance patterns from controllers and noncontrollers working specific rapidly rotating schedules. Problem areas, coping strategy and countermeasures development, and implementation research are discussed.

ENHANCING NEUROLOGICAL PERFORMANCE IN NAVAL AEROSPACE USS CARRIER GROUND AND SUPPORT OPERATIONS: PRACTICAL CHALLENGES

Barker, C. O., Naval Aerospace Medical Inst., USA; Hain, R. E., Naval Aerospace Medical Inst., USA; Apr. 1996; 10p; In English; See also 19960053795; No Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Flight operations aboard an aircraft carrier resemble operations at a busy, land based airport, only compressed into a small space. The flight operational environment is intense, prolonged, and very hazardous. This is especially true for the carrier's flight deck personnel who handle ground and support operations. This paper will discuss the major risk factors affecting flight deck personnel performance, the neurological implications, and practical challenges to enhancing performance. High workload, sustained operations, heat and cold stresses, wind and rain, neurosensory deficiencies, noise and vibration, as well as acute and chronic injury, emotional and interpersonal problems are all risk factors that can lead to neurological limitations affecting flight deck performance. Fatigue, lethargy, sleepiness, headaches, potential head, neck, and back injuries, as well as decreased visual acuity and hearing, peripheral neuropathies, decreased cognitive, motor, and coping functions are among the potential neurologic problems. These conditions will limit flight deck performance. These factors lead one to consider a number of efforts that could potentially enhance flight deck performance. Consideration of these presents a number of challenges. How can we better screen and periodically evaluate flight deck personnel for the 'right stuff'. Would a formal, more quantitative daily risk assessment and management program enhance overall flight deck performance? How should we address current education and training safety programs to enhance performance? How can we better handle morale issues that affect performance? Finally, potential applications of research findings to enhance neurologic performance in flight deck personnel present unique challenges. For example, should performance enhancing drugs be used, and if so, when and how?

SIMULATED VISUAL SCENES: WHICH ARE THE CRITICAL CUES?

McIntyre, H. M., Thomson Training and Simulation Ltd., UK; Roberts, M. E. C., Thomson Training and Simulation Ltd., UK; Apr. 1996; 8p; In English; See also 19970000594; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Research has shown that pilots can extract information from relatively impoverished visual scenes. However, performance of a variety of simulated flight tasks improves with greater scene complexity. Simulator visual systems cannot replicate the real world. Further, it is not possible to optimize visual system performance in all areas simultaneously. Some improvements in flight simulator visual cueing will come inevitably, as technology advances. Others present a research challenge, particularly where the likely effects of missing, contradictory or distorted information are not fully understood. These include: The luminance dynamic range of the display; this is far less than that encountered in reality. Relative luminances between objects cannot be maintained. Luminance variations with range will therefore be distorted. Maintaining accurate colour ratios at low luminances is also difficult. By careful mapping, detection ranges could be adjusted to be nominally accurate under specific conditions but not continuously accurate. The implications need to be considered carefully. The simulation of night scenes, with some illuminated areas may require the simultaneous mixing of 2 or 3 models in the same scene, creating unusual data base management demands. This requires further investigation. Distance judgments may be observed to be inaccurate in the simulator. To prevent this leading to degraded simulator performance and deficiencies in training it may be possible to compensate for the absence of some cues by enhancing the effect of others. Further

investigation is required to establish whether such compensation is truly possible, to what degree it enhances simulator effectiveness and to identify associated costs.

VISUAL SCENES FOR BATTLEFIELD HELICOPTER OPERATIONS: EVALUATION OF REQUIREMENTS AND HOW TO SPECIFY THEM

Deighton, C. D. B., Cranfield Univ., UK; Woodfield, Alan A., Woodfield Aviation Research, UK; Apr. 1996; 12p; In English; See also 19970000594; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

The structured specification and evaluation of simulated visual scenes for training pilots in tasks such as Battlefield Helicopter operations is required to ensure that cost-effective flight simulator training is being achieved. Historically this has been a difficult process because of a lack of consistent and prioritized descriptions of different visual flight activities within the intended training missions; limited evaluations of the contributions and relative importance of different scene features within appropriate operational scenes; and a lack of any structured way of collating and presenting such information to those who specify and design visual scene databases for flight training simulators. A research program funded by the UK Defence Research Agency was conducted in collaboration with Cranfield University, UK to address these challenges. Specific aims were to identify and prioritize visual flight activities in the context of a battlefield nap-of-the-earth (NoE) attack mission; to determine the relative importance of visual scene components (e.g. woods, farm buildings, roads, livestock) to the achievement of visual flight activities; and to assess the impact of removing or adding information to the scene upon the achievement of visual flight activities in a mission simulator. The purpose of the paper is twofold: firstly to describe the human factors procedures and techniques used to address these aims and secondly to describe the proposed structure of a computer based relational database to integrate the results of the program. Selected findings from the study are used to highlight the structure of the database.

This paper presents the results of an operational evaluation of the training effectiveness of three different visual technologies. Purpose of the program was to determine (1) trainability of low altitude tasks on available visual display technology; (2) demonstrate current visual simulation technology to users; (3) get feedback from those users to help define future visual requirements; and (4) provide information and data to support future simulation acquisition decisions. Three visual simulation display technologies at three different sites were evaluated: (1) a dome display with head tracked area-of-interest, (2) a rear-projection display, and (3) a fiber optic helmet mounted display. A team of highly experienced F-16C and F-16E instructor pilots evaluated each of the three display technologies. Three evaluation missions were flown by each pilot. At the completion of each evaluation mission, extensive questionnaires were completed and de-briefings were conducted to rate the training capability of the visual system for each task. Results are presented for each of the three display systems evaluated. The results are expressed in terms of tasks that were rated trainable and those tasks that were not trainable in the system.

YAW MOTION CUES IN HELICOPTER SIMULATION

Schroeder, Jeffrey A., NASA Ames Research Center, USA; Johnson, Walter W., NASA Ames Research Center, USA; Apr. 1996; 16p; In English; See also 19970000594; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

A piloted simulation that examined the effects of yaw motion cues on pilot-vehicle performance, pilot workload, and pilot motion perception was conducted on the NASA Ames Vertical Motion Simulator. The vehicle model that was used represented an AH-64 helicopter. Three tasks were performed in which only combinations of vehicle yaw and vertical displacement were allowed. The commands issued to the motion platform were modified to present the following four motion configurations for a pilot located forward of the center of rotation: (1) only the linear translations, (2) only the angular rotation, (3) both the linear translations and the angular rotation, and (4) no motion. The objective data indicated that pilot-vehicle performance was reduced and the necessary control activity increased when linear motion was removed; however, the lack of angular rotation did not result in a measured degradation for almost all cases. Also, pilots provided subjective assessments of their compensation required, the motion fidelity, and their judgment of whether or not linear or rotational cockpit motion was present. Ratings of compensation and fidelity were affected only by linear acceleration, and the rotational motion had no significant impact. Also, when only linear motion was present, pilots typically reported the presence of rotation. Thus, linear acceleration cues, not yaw rotational cues, appear necessary to simulate hovering flight.

ISSUES IN THE DEVELOPMENT OF TRAINING ANALYSIS METHODOLOGIES

Simpson, Terry, Thomson Training and Simulation Ltd., UK; Apr. 1996; 8p; In English; See also 19970000594; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Training analysis is a topic that is often talked about and less often carried out. Various methods have been proposed in the past, but many of these have been too complex and too prescriptive for practical purposes. Major system procurements on cost-plus contracts in the past may have justified detailed methodologies, but the majority of modern training analysis is required on small fixed price contracts. The training analyst is often solely responsible for the work, or working in a small group of 2 or 3. Consequently, the analyst has to use techniques that can be easily applied and be flexible enough to carry over from one contract to another. This paper describes a range of issues that affect training analysis and presents a simple methodology that can be easily adopted by analysts and applied to commercial situations.

DELAYED PILOT RESPONSE IN WINDSHEAR

Schaenzler, G., Technische Univ., Germany; Krueger, J., Technische Univ., Germany; Apr. 1996; 10p; In English; See also 19970000594; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Windshear can cause fatal accidents. To pass windshear situations safely, the automatic flight control should be employed. This advice is in contrast to an FM recommendation to switch off the autopilot in a windshear and to perform a go-around procedure. With conventional instrumentation and manual approach extremely large time delays up to 40 seconds could be identified. It is still unclear what the psychological reasons for this delay are. There are some indications that the human being reacts like a band pass filter. With proper display information a thrust command director can be realized that may force the pilot to react correctly and safely in windshear situations.

These proceedings include the Technical Evaluation Report, Keynote Address, Paper Presentations, and Poster Display Presentations of the Symposium sponsored by the AGARD Aerospace Medical Panel and held at the Ministry of Defence, Prague, Czech Republic, 28-31 May 1996. Over the last few decades, aircraft and air operations have become more sophisticated. Technological innovations have resulted in higher-performance, more-complex weapons systems. That increased performance and complexity have placed greater physical and psychological demands upon aviators. Refinement of materiel and improvements in selection and training technologies have enabled aviator selection and training processes to evolve. The purpose of this Symposium was to unite military and civilian experts in the field of selection and training. The papers addressed aviator selection and training, including: human abilities measurement; anthropometric accommodation; gender differences; crew resource management; flight simulators; spatial disorientation; cost effectiveness; centrifuge training; and g-tolerance. These proceedings will be of interest to those concerned with selection criteria, progression in selection techniques, training processes, physiological training, and facility advances in aviation. Interaction of medical, physiological, cognitive, psychomotor, and personality factors in the selection process are highlighted.

ADVANCES IN USAF PILOT SELECTION

Weeks, Joseph L., Armstrong Lab., USA; Zelenski, Warren E., Armstrong Lab., USA; Carretta, Thomas R., Armstrong Lab., USA; Selection and Training Advances in Aviation; Nov. 1996; 12p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Although modern aviation technology provides tremendous advantages, there is concern that complex cockpit systems may introduce psychological problems for aircrew. This concern is particularly relevant for pilot training. Such problems could result in loss of life and increased training costs. For trainer aircraft currently used in USA Air Force (USAF) Undergraduate Pilot Training (UPT), training costs are high. The cost of an eliminatee from pilot training can be as much as \$350,000 depending on when elimination occurs in the training process. In the past, pilot selection systems have helped identify those individuals most capable of successful performance in UPT. In the future, pilot selection systems can be developed to help minimize any adverse training impacts of modern aviation technology. Analyses of new cockpit systems can reveal the human capabilities required for successful training performance. In addition, advances in the measurement of human abilities allow us to fine tune pilot selection systems to identify candidates having the ability profiles required for training with complex modern aircraft. Use of candidate ability information by pilot selection boards results in improved person job match, higher quality trainees, lower training wastage and ultimately, improved air combat readiness.

CHARACTERISTICS OF FEMALE AND MALE USAF PILOTS: SELECTION AND TRAINING IMPLICATIONS

King, R. E., Armstrong Lab., USA; McGlohn, S. E., Armstrong Lab., USA; Selection and Training Advances in Aviation; Nov. 1996; 4p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

The determination of psychological fitness to fly is complicated, particularly when attempting to extrapolate what little we know about male aviators to women. New training needs, for both women and men, may arise as the number of a country's female aviators increases. The large numbers of aviators in the USA Air Force (USAF) enable it to do research that may be instructive to other, smaller, air forces.

The prevention of aviation accidents used to be, in the former Czechoslovak Air Force in the centre of Commands attention. A system access to solving this problem area achieved the lowest losses of pilots and planes in the 1970s. Within the framework of validation of the methods, used in selection and training procedures, the analysis of the level in actual combat flight training was carried out in a fighter group (150 pilots) in the last years. The achieved results confirmed the reliability of psychophysiological examination with cadets and the prognostic validity of the criteria used in the selection processes. With the 90% level of significance the hypothesis of personality predisposition to errors in flying by the individuals having a lower level of cognitive functions development and with the manifestation of the emotional irritability has been confirmed. The characteristics of test batteries and the relevant criteria used for the expertise together with account of incidents and accidents will be dealt with.

THE CANADIAN AUTOMATED PILOT SELECTION SYSTEM (CAPSS): VALIDATION AND CROSS VALIDATION RESULTS

Adams-Roy, J. E., Canadian Forces Personnel Unit, Canada; Selection and Training Advances in Aviation; Nov. 1996; 2p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

The current pilot selection system used by the Canadian Forces to assess pilot applicants incorporates paper and pencil ability tests, and an evaluation of psychomotor skill measured on a general aviation trainer. Each measure is weighted differently and the scores are then combined together to give candidates a final Pilot Stanine (PS). Although able to satisfactorily select candidates for pilot training, the increasing complexity of modern aircraft and the high costs associated with training have led the CF to adopt a new selection measure, the Canadian Automated Pilot Selection System (CAPSS) which will be implemented in January 1997.

Eighteen healthy males with different degrees of flight experience were tested during piloting an L-29 jet-trainer plane during 54 standardized aerobatic flights. In 13 pilots up to four successive aerobatic flights were realized, separated by half an hour intervals on the ground. The ranks of the expert evaluated in-flight psychomotor performances during standardized aerobatic flights and of the values of the individual total flight time hours were highly significantly correlated ($r = 0.86$). Computer based analysis of the quality of performance of flight

maneuvers showed that the pattern of piloting the plane was highly individual. Nevertheless, the coefficient of reliability of the courses of repeated flights of experienced pilots (normalized as to the duration of each maneuver and the maximal G-level reached) equaled to $r = 0.97$. Evidently, the individual pattern of flying is a stable characteristic of the performance of experienced pilots. It is something like their signature. Results of analysis were compared with other indices of pilot's performance under the influence of hypergravity.

CURRENT STATUS AND FUTURE DEVELOPMENTS OF RAF AIRCREW SELECTION

Bailey, M., Royal Air Force, UK; Woodhead, R., Royal Air Force, UK; Selection and Training Advances in Aviation; Nov. 1996; 10p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper summarizes the current status of the RAF aircrew aptitude selection process against work conducted during the previous decade and identifies a number of problems and possible future directions. An ability domain structure was explored and incorporated into the current test development policy. This concept was further expanded to develop a validation model which uses wider and more detailed criteria to provide a more accurate and informative estimate of selection measure validity.

A new concept in selection of the future fighter pilot generation was created in 1992 by the Surgeon General of the German Air Force. In addition to the basic medical, physical, and psychological examination at the German Air Force Institute of Aviation Medicine (GAFIAM) at Fuerstenfeldbruck the natural, unprotected, relaxed G-tolerance of the healthy young men, which have passed the examination successfully, was determined in the human centrifuge on a voluntary basis. In connection with the consideration of the medical and psychosomatic findings just before and during the determination of the G-tolerance the individuals were scored. Based on this score three categories were established as recommendation for a possible pilot career of the candidates in high performance aircraft. The mean age of the 304 pilot candidates was 20 ± 1.6 years. They reached a relaxed, unprotected G-tolerance of 4.6 ± 0.5 g. The classification of this evaluation, with regard of the heart rate and mental stress reaction signs, of the last 129 of these 304 candidates, was: 45 especially qualified, 75 qualified, and 9 less qualified. The score of the first 22 re-evaluated candidates during the G-training course in Koenigsbrueck about two years later showed no major change in the score in comparison with the first screening results. These first findings in the comparison of the results of the early phase evaluation and the G-tolerance during the G-training course allows to suppose, that the selection of pilots, added by the human centrifuge screening methods, offer a new chance to make the screening more effective and reach both: satisfy the candidates, and the German Air Force.

The cost of modern combat aircraft requires that they are operated safely in peacetime. Equally, the nature of air operations demands their aggressive operation in war. The challenge is to recruit people who can satisfy these 2 differing requirements. Moreover, this has to be done against a background of the difficult recruiting, manning and experience issues facing many modern Air Forces. The challenge is to identify and train effectively the correct number and balance of fighter pilots for the 21st Century.

THE USAF'S ENHANCED FLIGHT SCREENING PROGRAM: PSYCHOLOGICAL ASSESSMENT OF UNDERGRADUATE PILOT TRAINING CANDIDATES

Callister, J. D., Armstrong Lab., USA; Retzlaff, P. D., University of Northern Colorado, USA; Selection and Training Advances in Aviation; Nov. 1996; 6p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The Enhanced Flight Screening (EFS) program consists of both flying and medical screening. This paper will focus on the psychological assessment techniques of the EFS program. Measures of intelligence and cognitive abilities are included. Undergraduate Pilot Training candidates are required to take the Multidimensional Aptitude Battery, an intelligence test, and the CogScreen-Aeromedical Edition, a measure of cognitive skills. Over 1,500 candidates have completed the EFS program. Ninety-four percent of the candidates have consented to allow their data to be used for research. Intelligence testing scores are well above average. Pilot candidates differed from commercial pilots on several cognitive measures. Commercial pilots were more accurate on measures of math abilities, while pilot candidates were more accurate on measures of memory. Commercial pilots were more efficient with most cognitive tasks, except that pilot candidates were more efficient with dual and divided tasks. Commercial pilots made more perseverative errors, while pilot candidates made more impulsive errors. Computer administration of psychological tests makes it possible to efficiently collect clinically relevant data on all candidates. Collection of this data for each candidate will improve the quality of medical waiver recommendations through the use of idiographic data. Collectively, this process provides an infrastructure for productive longitudinal selection research.

SIMULATOR BASED TEST SYSTEMS AS A MEASURE TO IMPROVE THE PROGNOSTIC VALUE OF AIRCREW SELECTION

Gress, W., Air Force Inst. of Aviation Medicine, Germany; Willkomm, B., Air Force Inst. of Aviation Medicine, Germany; Selection and Training Advances in Aviation; Nov. 1996; 4p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

A simulator based aviation psychological test system in use in the German Air Force called the 'FPS 80' which is the German abbreviation of 'Aviation Psychological Selection System 80' is described to point out the advantages and the disadvantages of simulator based tests in comparison to classical psychological tests. While classical psychological tests try to examine single abilities simulator based test systems measure a student pilot's abilities in a complex test situation similar to a real training situation. The role of the FPS 80 within the sequential selection strategy of the GAF will be described in the study. The results of a study based on the data of over 300 student pilots of the years 1994 and 1995 show that the prognostic value of the whole selection system could be increased considerably by using simulator based tests. The prognostic value of the selection process becomes evident in the correlations of psychological data and the results of academic training and of flight training in the flying screening. A comparison of the prognostic value with and without the use of the FPS 80 shows that the correlation of the whole selection process could be increased from .3 to over .5. The results also show that the prognostic value of the FPS 80 itself could be increased by adding data from a

psychological observation of behaviour to the computer generated test scores. As a conclusion the advantages and the limits of such a simulator based test system are pointed out.

Recent advances in aircrew training methods and technologies now allow the Air Force to conceptualize training as the peacetime manifestation of war. That is, ground-based pilot training can now move beyond simply training procedural skills to training wartime mission skills on a much more frequent basis than past training range training has allowed. We discuss R&D advances in three key areas that will truly allow the Air Force to train as it intends to fight. These three areas are 'Warfighter Training Behavioral Research', 'Distributed Mission Training Engineering Development', and 'Night Vision Device Training R&D'. Under each of these three main categories of R&D we discuss specific advances made in our laboratory. We also discuss future directions that we believe aircrew R&D should advance in order to provide synthetic training environments that will allow the full measure of warfighting skills to be trained.

TRAINING OF AIRCREW DECISION MAKING

Hormann, Hans-Jurgen, Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Selection and Training Advances in Aviation; Nov. 1996; 6p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Aircrew decision making is one central element of the CRM-training course for cockpit crews which was developed recently by the DLR-Department of Aviation and Space Psychology in cooperation with Lufthansa German Airlines and Condor. Examples of the course contents and methods are illustrated. As a framework for the training units of aircrew decision making the FOR-DEC model is proposed. FOR-DEC is an acronym which stands for six different phases of the decision making process: Facts, Options, Risks & Benefits, Decision, Execution and Check. The paper describes how this model is integrated into the training units on team problem solving and decision making. First evaluation results of the course are shown which are based on the seminar critiques of 750 participants. These feedbacks are very positive in regard to the overall relevance of the course contents and methods. However, they also indicate the importance of authentic in-house scenarios for the effectiveness of the seminar processes.

UNDERSTANDING THE REQUIREMENT: A REVIEW OF COMMON PROBLEMS IN TRAINING, SELECTION AND DESIGN

Cook, Malcolm, Abertay Univ., UK; Ward, George, ESE Associates, UK; Selection and Training Advances in Aviation; Nov. 1996; 20p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

A recent review of pilot selection procedures cast doubt upon the predictive capabilities of pilot selection batteries to identify the specific qualities that identify good pilots in the initial stages of the selection process. In other contributions to the same text many authors poured scorn on the relatively poor quality of psychological tools in selecting out ineffective pilots or in evaluating pilot's performance with laboratory based tasks. Three conclusions can logically be drawn from this work, presentations at the AGARD Spring Symposium in 1995 on Situational Awareness and other papers in the open literature. Either the tests applied in selection of pilots are poor in themselves, the understanding of the cognitive demands placed on pilots is poor or the both the tests, understanding of tasks and their application are suspect. Although there have been reports which suggest that predictive validity may, indeed, be declining in tests used in pilot selection the problem underpinning the ineffective selection may be inadequate quantitative and qualitative descriptions of the pilot's tasks.

PERFORMANCE AND WORKLOAD MEASUREMENT IN SIMULATION-BASED TRAINING

Newman, P., Defence Research Agency, UK; Farmer, E. W., Defence Research Agency, UK; Belyavin, A. J., Royal Air Force, UK; Selection and Training Advances in Aviation; Nov. 1996; 12p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Experiments were conducted to determine the utility of measures of skill acquisition in simulator-based training. Objective performance measures were supplemented by workload measures, to permit assessment of possible changes in demand for mental resources during task learning. In the two experiments reported here, performance measures of speed, accuracy and continuous manual control were found to satisfy criteria such as sensitivity to practice and to individual differences. Several workload measures, particularly the DRA Workload Scales, also provided useful and reliable information. However, provision of performance feedback to the subject during training sessions had a limited effect on skill acquisition. On completion of this series of experiments, standardised batteries of measures will be specified for application to training.

Before starting the pilot school in USA the young, G-inexperienced student pilots were trained on the human centrifuge (HC) at Koenigsbrueck near Dresden, Saxony. This G-training is an integrated part of their one-week basic physiological training course. The objective of this course is, that the students become familiar with the G-environment safely. In the beginning of the G-training the student pilots were exposed to the same G-profiles as the pilot candidates. On the second day they were trained in muscle straining and anti-G-breathing technique during moderate HC runs with and without anti-G-equipment. Then they were able to use these techniques in the HC during active profiles. The result and effectiveness of this training will be documented by a special qualification profile. This qualification profile consists of the same passive linear profile as on the first day. The student pilots don't wear anti-G-trousers. During the increasing G-load they should first stay relaxed, until they reach their 50% peripheral light loss (1. PLL). In this moment they activate their muscle straining, until they reach the second time PLL (2.PLL). Now they start the anti-

G-breathing technique until they reach their individual maximum active G-tolerance (3. PLL). The results of the G-training of the first 198 student pilots, mean age 22.9 + 1.7 years, mean height 180.3 + 5.5 cm, body mass 76.8 + 7.9 kg indicate, that that the muscular straining manoeuvre will increase the G-tolerance by about 1.0 gz, and the additional breathing manoeuvre will increase the G-tolerance by another 1.5 gz, totally 2.5 gz even under artificial, not operational conditions.

The Canadian Aeromedical Training Program has recently undergone significant changes. Other countries are also reviewing their aeromedical training programs and looking for new or different ways to provide the necessary academic training at the correct frequency using the best methods possible. The U.S. Navy has completed an extensive review of its program and is currently exploring the possibility of providing continuation aeromedical training in conjunction with flight simulator training. The Royal Australian Air Force already uses an innovative approach to provide night vision training that may be appropriate for use by other countries. It seems inevitable that aeromedical training programs will continue to change in the future. To ensure that these changes are appropriate and that they improve flight safety, it is essential that measurement tools be developed to assess current programs and to determine what changes should be made. Due to current and potential changes in aeromedical training programs, it would seem appropriate, in the interests of international standardization of aeromedical training in the future, to revise the terms of STANAG 3114.

CENTRIFUGE TRAINING IN THE CANADIAN FORCES: A REVIEW OF THE FIRST SIX YEARS' EXPERIENCE

Bateman, William A., Defence and Civil Inst. of Environmental Medicine, Canada; Selection and Training Advances in Aviation; Nov. 1996; 6p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

In the late 1980s, the Canadian Forces developed and implemented a centrifuge training program intended to enhance the preparedness of its aircrew for the G-stress of modern fighter aircraft. In the six years from 15 June 1989 until 25 May 1995, 439 personnel attended 97 serials of this one-day course. Although a rigid performance standard was not set, aircrew from various CF pilot populations completed the target profile with success rates ranging from 61-83% (the more experienced fighter pilot groups doing better). The lessons learned in this first six years have paved the way towards a new program, with broader mandatory target population, provisions for refresher training, and G-tolerance improvement for those unable to complete the target profile.

Simulation used in aviation has been with us in some shape or form since the early 40's. These early devices were primarily used to

teach basic flying skills and because of their simplicity had known limitations. Today's simulators are very expensive, complex and demanding devices which attempt to approximate the real world. They provide, not unlike the real aircraft, a multi-use capability where they are used for everything from teaching basic flying skills to mission rehearsals and accident investigation. These costly complicated systems sometimes provide questionable results because the designers, buyers, users and human factors specialists (which are all too often not involved) have not established a well defined set of requirements with respect to the simulators primary use. Nor do they fully understand the transfer of training from the simulator to the real world. To help understand or improve the transfer of training, human factors personnel should be involved in almost every facet of the simulators from conception to inception.

The performance features which a helmet visual display unit must have in order to satisfy requirements of low-altitude flight simulators and multi-purpose simulators are analyzed here. The design of the SIMEYE 90 large field helmet visual display unit which allows one to satisfy these requirements is analyzed and the technical compromises are explained. The results from using the helmet visual display unit on a helicopter simulator are then presented. They allow one to achieve better performance than when using screen projection, with the exception of weight which is found to be disturbing by pilots who are not accustomed to wearing night vision binoculars.

THE EFFECTS OF SPATIAL AUDITORY PREVIEW ON VISUAL PERFORMANCE

Elias, Bartholomew, Armstrong Lab., USA; Jun. 1997; 8p; In English; See also 19970026380; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Since the auditory system is not spatially restricted like the visual system, spatial auditory cues can provide information regarding an object's position, velocity, and trajectory beyond the field of view. Recent studies (e.g., Perrott, Cisneros, McKinley, & D'Angelo, 1995) have demonstrated performance benefits in static visual search tasks over large spatial extents when visual targets have been augmented with spatial auditory position cues. The benefits of spatial auditory display augmentation have also been demonstrated in applied settings such as airborne traffic collision avoidance systems (Begault, 1993). Research has also shown that spatial auditory displays are potentially useful for enhancing cockpit situational awareness and reducing visual workload in tactical aircraft operations (McKinley, et al., 1994). The research program described here adds to these initial findings regarding the utility of spatial auditory displays by demonstrating that visual displays can be augmented with dynamic spatial auditory preview cues that provide information regarding the relative position, velocity, and trajectory of objects beyond the field of view. In one experiment, the effects of a spatial auditory preview display were examined in a visual target aiming task. A moving sound source provided cues regarding the position and velocity of moving targets prior to their appearance on the visual display, by providing these spatial auditory preview cues, greater accuracy was achieved in the visual target aiming task. In a second experiment, dynamic spatial auditory cues presented through headphones conveyed preview information regarding target position, velocity, and trajectory beyond the field of view in a dynamic visual search task. The provision of spatial auditory preview cues significantly reduced response times to acquire and identify moving visual targets that traversed a cluttered display and significantly reduced error rates in target classification. These

findings demonstrate that spatial auditory preview can augment visual displays and enhance performance in complex, dynamic task domains such as aviation.

THE ABILITIES OF LISTENERS TO LOCALISE DEFENCE RESEARCH AGENCY AUDITORY WARNINGS

Martin, Russell L., Aeronautical Research Labs., Australia; Parker, Simon P. A., Aeronautical Research Labs., Australia; McAnally, Ken I., Aeronautical Research Labs., Australia; Oldfield, Simon R., Aeronautical Research Labs., Australia; Jun. 1997; 8p; In English; See also 19970026380; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The Defense Research Agency (DRA) in collaboration with the Applied Psychology Unit at Cambridge University and the Institute of Sound and Vibration Research at Southampton University have designed a set of 12 auditory warnings for use in military aircraft. These warnings have recently been modified to extend their high-frequency content in an attempt to increase the accuracy with which they can be localized and therefore enhance their suitability for use in conjunction with a 3D audio display. We have evaluated the abilities of listeners to localize a sample of the original DRA auditory warnings and their high-frequency versions. Eight subjects localized broadband noise and five original warnings when presented from a loudspeaker at each of 40 locations ranging from -40 to +40 deg azimuth and -50 to +50 deg elevation in their frontal hemifields. Subjects were divided into two groups of four subjects each on an age basis: 22-28 year olds and 33-48 year olds. Consistent with the results of previous studies, an average localization error of about 5 deg was observed for a train of three 150 ms bursts of broadband noise for both age groups. Average localization errors for the five original auditory warnings, however, were much larger and varied from about 10 to 25 deg for the younger subjects and 15 to 30 deg for the older. Four subjects, aged from 23-39 years, then localized three modified versions of two of these original warnings. Of the three modification methods employed, only one (fine-structure doubling) produced stimuli that were localized more accurately than their original versions. The improvement in localization accuracy for stimuli modified by this method resulted primarily from an improvement in the accuracy with which the elevation of the stimulus could be determined.

USE OF OBJECT ORIENTED PROGRAMMING TO SIMULATE HUMAN BEHAVIOR IN EMERGENCY EVACUATION OF AN AIRCRAFT'S PASSENGER CABIN

Court, Mary C., Oklahoma Univ., USA; Marcus, Jeffrey H., Civil Aero-medical Inst., USA; Sep. 1997; 8p; In English; See also 19970034906; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The paper presents an object-oriented framework to model human behavior under both certification and accident evacuations. The framework opens up a new area of analysis by proposing a paradigm for predicting human behavior. Object oriented programming lends itself to the modeling of complex systems by supporting a one-to-one correspondence with the physical world, and thus, eases the burden of model validation. Easing model validation is of particular importance when the real-system's environment is hazardous, and performing tests on the real-system is either impossible or not repeatable.

The world-wide accident statistics indicate that the number of accidents has decreased over the last two decades. Unfortunately, the dramatic reduction in the overall accident rate was accompanied by a less dramatic reduction in the fatality rate of those onboard an aircraft which is involved in an accident. Nevertheless, recent analyses conducted by the FAA have indicated that fire has become less of a risk; in survivable accidents. In the early 1980s, FAA attributed 40 percent of fatalities in survivable accidents to fire effects. A review of US airline accidents that occurred between 1985 and 1991 showed that approximately 10 percent of fatalities were related to fire. Whilst no two accidents can be the same, it is possible to learn from the similarities and difference between the cause of the accidents, their location, and the environmental condition present, the types of passengers onboard and their responses to the emergency. There are a great many questions which as yet we are not able to answer about the behaviour of people in emergencies, including the important question of why in some accidents the passengers evacuate in an orderly manner, and in other accidents the behaviour is disorderly. This paper discusses an evacuation technique that has a potential to provide both the behavioural and statistical data required for assessment of design options or safety procedures for use in emergency evacuations.

THE ROLE OF EVACUATION MODELLING IN THE DEVELOPMENT OF SAFER AIR TRAVEL

Galea, E. R., Greenwich Univ., UK; Owen, M., Greenwich Univ., UK; Lawrence, P., Greenwich Univ., UK; Sep. 1997; 14p; In English; See also 19970034906; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Computer based mathematical models describing the aircraft evacuation process have a vital role to play in the design and development of safer aircraft, in the implementation of safer and more rigorous certification criteria and in post mortem accident investigation. As the risk of personal injury and costs involved in performing large-scale evacuation experiments for the next generation Ultra High Capacity Aircraft (UHCA) are expected to be high, the development and use of these evacuation modeling tools may become essential if these aircraft are to prove a viable reality. In this paper the capabilities and limitations of the air-EXODUS evacuation model are described. Its successful application to the prediction of a recent certification trial, prior to the actual trial taking place, is described. Also described is a newly defined parameter known as OPS which can be used as a measure of evacuation trial optimality. Finally, the data requirements of aircraft evacuation models is discussed along with several projects currently underway at the University of Greenwich designed to obtain this data. Included in this discussion is a description of the AASK - Aircraft Accident Statistics and Knowledge - data base which contains detailed information from aircraft accident survivors.

As the NATO alliance enters into a new era, with new roles and new missions, a new R&D structure will emerge. AGARD has been a splendid organization, existing at the heart of the alliance. It seems that NATO must now move beyond an information sharing and advisory role to a sponsor of multinational scientific projects. It is time to take advantage of the combined sample size in order to reach significant

conclusions sooner and with greater confidence. It is time to organize our centers of excellence into a collaborative mode in order to assure that the human subsystem is both affordable and effective. In several key areas of aerospace medical research, there is no alternative to the NATO sponsored multinational project.

Many of the pilots who will be flying in the year 2020 are just now being born or are currently very young children. We will know more about these pilots than we presently know about our current pilots. The air forces of the future will surely include many more women as they will likely compete on an equal footing and may be represented in all cockpits. Efforts currently underway, including Neuropsychiatrically Enhanced Flight Screening, Assessment of Psychological Factors in Aviators and Psychological Factors of Aviators' Success may bear fruit and answer the question of whether female pilots self-select into aviation or if they are shaped as a result of the process of pilot training. The year 2020 may see the Armstrong Laboratory Aviator Personality Survey as a well established test for use with aviators, with international norms. As we invest increasingly large amounts of money into each individual airframe and mission, we must learn more about the human operator, whether that individual is a pilot or a controller of a pilotless aircraft or spacecraft (Uninhabited Aerial Vehicle).

EVALUATING CREW PERFORMANCE AFTER ANTI-EMETICS: A SCREEN FOR ASSESSING MILITARILY RELEVANT MEDICATIONS

French, Jonathan, Air Force Research Lab., USA; Benline, Terry A., Air Force Research Lab., USA; Poole, Eric, Air Force Research Lab., USA; September 1998; 10p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Prophylactic, pharmaceutical countermeasures hold the potential to protect aircrews from a wide variety of threats during contingency operations, ranging from fatigue to radiation exposure. In order to assess the impact of these potential countermeasures on cognitive abilities, a 2-phase drug screen was developed. A battery of cognitive, affective and physiological measures was utilized in Phase I of testing to rapidly evaluate the performance liability of militarily relevant compounds. The carefully controlled Phase I lab study incorporated diurnal and nocturnal performance trials to assess potential drug interactions with circadian and sleep deprivation effects. During Phase II, flight performance was tested in a high fidelity aircraft simulator using embedded operational tasks, expert evaluation and subjective metrics. The Phase I screen evaluated two novel anti-emetic compounds, granisetron (2 mg) and ondansetron (8 mg), compared to placebo and a positive control, prochlorperazine (10 mg), in a double blind, crossover study of 24 subjects. Performance was assessed hourly from 1800 until 0200. All Phase I metrics were degraded during nocturnal performance trials for all drug conditions, presumably due to circadian and sleep deprivation effects. The positive control was identified by the divided attention task in terms of accuracy ($p < 0.05$) and reaction time ($p < 0.05$) and by the mean lambda for the tracking task ($p < 0.05$), but only during a time when blood levels of prochlorperazine were elevated. None of the affective state questionnaires were able to identify the positive control, suggesting that the dose was low enough that the participants were unable to discern it. None of the target anti-emetic compounds differed from placebo suggesting that they were not likely to affect sensitive performance. Phase II also revealed no differences between target anti-emetic compounds and placebo in any

of the segments of an F-16 defensive counter-air mission flown by 9 pilots. Based on these tests, the target compounds were considered safe to use prophylactically, with respect to cognitive ability, for crews in danger of radiation exposure. The utility of the drug screen as a rapid and thorough means to assess the cognitive impact of militarily relevant compounds was established.

MELATONIN AND ITS ROLE IN CIRCADIAN RHYTHM DISRUPTION

Brown, Gregory M., Clarke Inst. of Psychiatry, Canada; Vos, Evert C., Clarke Inst. of Psychiatry, Canada; September 1998; 10p; In English; See also 19990025670; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Melatonin, the hormone of the pineal gland, is secreted during the hours of darkness with virtually no secretion during light and has therefore been called the hormone of darkness. Its secretion is controlled by an endogenous rhythm generating system that is entrained by light. Melatonin has a role in cuing circadian rhythms, notably the sleep-wake rhythm, promoting sleep, and contributing significantly to the circadian rhythm in body temperature. Specific receptors for melatonin have been cloned recently which mediate these and other effects. (Melatonin can be given orally, intravenously, by nasal spray or trans-buccally and has a wide safety margin.) Administration of melatonin orally (in a dose of 0.5 to 5 mg) or light treatment (300 to 5000 lux) has established therapeutic actions in circadian rhythm sleep disorders, including disorders associated with jet lag, shift work, delayed phase sleep disorder, periodic sleep disorder in blindness and sleep and behavioural disorders in children with multiple brain damage. Treatment of circadian rhythm disorders with light or melatonin requires an understanding of the manner in which these agents produce effects on body rhythms. Effects of light and melatonin treatment follow a phase response curve. Evening light treatment causes a phase delay in the sleep-wake cycle while morning light causes a phase advance. As is befitting the hormone of darkness, melatonin treatment produces effects which are nearly the mirror image of light.

This report is comprised of Chapters 1 through 7 of the Designer's Guide to Human Performance Modeling, presented by Working Group-22 as a joint effort between the Flight Vehicle Panel and the Aerospace medical Panel of AGARD. Chapter 1 of the Designer's Guide presents a brief description and the current status of Human Performance Modeling followed by an outline of the organization of the report as a whole. The remaining chapters, 2 through 7 discuss the following topics: 1) Applications of HPM's (Human Performance Models); 2) Taxonomy of Models; 3) Model Limitations; 4) Implementation Issues; 5) Description of the Expert System; and 7) Recommendations for future work.

The Integrated Performance Modelling Environment (IPME) programme was established in 1995 in the UK Ministry of Defence Corporate Research Programme (CRP) under TG5 with the objective of developing a methodology for quantifying the human performance to system effectiveness. The approach adopted to meeting this requirement, was to develop a software framework based on earlier US work, which would permit the description of the human interaction with the system and the environment based on a task analysis approach. The software framework provides the means to simulate the interaction between man and system based on a task network logic flow.

WORKED EXAMPLE OF THE USE OF PUMA IN A FUNCTION ALLOCATION TASK

Day, P., Roke Manor Research Ltd., UK; A Designer's Guide to Human Performance Modelling; December 1998, A2-1 - A2-5; In English; See also 19990032479; Copyright Waived; Avail: CASI; A01, Hardcopy; A02, Microfiche

The PUMA method and toolset was used in an allocation of function study, involving the reengineering of a major civil Air Traffic Control system. As is the case in advanced, process-control like systems, one of the major issues facing designers is the extent to which functions formerly undertaken by humans in the system may usefully be automated. In the case of ATC systems, safety remains the paramount consideration, but there is also a growing requirement to increase system throughput as the levels of civil air traffic continue to grow. For this reason, civil aviation authorities around the world are increasing their level of investment in ATC systems, and in many cases replacing obsolete systems with new technology. ATC remains however a human-centered control activity, a situation that is unlikely to change in the foreseeable future, and hence one of the major issues that faces designers is the extent to which system functions may usefully be delegated to computer control while still keeping the human firmly in the loop. The study described was undertaken in this context, and is an illustration of the use of the PUMA method and toolset for the purposes of task analysis and workload estimation, thus enabling decisions on functional allocation to be taken.

WORKED EXAMPLE OF THE ORACLE TARGET ACQUISITION MODEL

Emmerson, P., British Aerospace Public Ltd. Co., UK; A Designer's Guide to Human Performance Modelling; December 1998, A6-1 - A6-14; In English; See also 19990032479; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

The following description makes up the problem space for the Target Acquisition Model. A designer is asked to provide a human operator with optimised values for the gain on an electro-optical sensor system in a land fighting vehicle. The gain (or 'temperature window') is known to affect target acquisition, and the designer decides to issues guidelines for the optimum gain for specific situations, based on predictions from a human visual target acquisition model. The chosen model, ORACLE, predicts target acquisition performance under a wide range of conditions, and can include performance with a variety of sensors. For this example, the thermal imaging model is used, in which a single parameter (gain) is iterated over a realistic range for the TI, for a single scenario (a given target and environmental conditions). A complete solution to the designers requirement would involve iterations over other variables (for example different atmospheric visibilities), but all such iterations would follow the procedure outlined. It is to be noted that this example has been chosen to show the potentially wide range of input parameters that can be used. The remainder of the report is made up of the process description, input/outputs from the case study, solution description and facility/resource requirements.

This report summarizes the deliberations of Working Group 11 of the Guidance and Control Panel of AGARD. The objectives of the Working Group are: (1) analyze the structure of knowledge-based guidance and control functions related to aircraft, missions, and the battlefield and identify their potential for automation; (2) analyze the structure of knowledge-based guidance and control functions related to the life cycle of guidance and control systems, and identify their potential for automation; (3) review the state-of-the-art of those software and hardware oriented technologies required for the transfer of the knowledge-based G&C functions to automatic systems; (4) review existing programs; and (5) make recommendations for future work.

AEROMEDICAL IMPACT OF THE TRANSPORTABLE PRESSURE VENTILATOR IN WARTIME AEROMEDICAL EVACUATION

Richardson, L., Department of the Air Force, USA; Munson, R., Department of the Air Force, USA; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 5 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A02, Microfiche

Mechanical ventilation permits the early air transport of patients in respiratory failure. Ventilator-dependent patients have been successfully air transported since the 1970's in the USA Air Force (U.S.A.F.) peacetime aeromedical evacuation system. The selection of suitable ventilation equipment, patient management and related safety issues, such as ventilator performance characteristics during rapid decompression, have been previously reviewed. During peacetime aeromedical operations, space is not usually an issue and volume ventilators are generally used. During wartime operations the bulky volume ventilator and the 100 volt AC (VAC) at 60 Hz electrical power converter are not readily available and take up too much space to be used on the C-130 and C-141 aircraft opportunely diverted from cargo missions to perform aeromedical evacuation. Each litter station in these cargo aircraft can hold up to ten litter patients. When a volume ventilator-dependent patient requires air transport, the litter station is typically reduced to only one or two litters. Recent conflicts such as Operations Just Cause and Desert Storm have refocused the need to provide acute care while enroute to definitive care. The projected large numbers of litter casualties and the potential increased demand for ventilator support for biological chemical or burn injuries during Desert Storm resulted in the distribution of the TXP ventilator to U.S.A.F. Aeromedical Staging Facilities. Use of the TXP ventilator has the potential of reclaiming the eight or nine litter positions lost during the air transport of a volume ventilator-dependent patient due to its ability to be attached to the patient's litter.

CARE IN THE AIR: A SYSTEM ANALYSIS OF CLINICAL OUTCOMES IN AEROMEDICAL EVACUATION

Saenger, Arleen M., Department of the Air Force, USA; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 7 p; In English; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

In 1993 a clinical outcomes study of the Continental USA (CONUS) Aeromedical Evacuation (AE) system was undertaken. Between 15 Feb. and 31 Oct. 1993, AE patients were screened for a

series of adverse clinical outcome indicators and process discrepancy indicators. Rates were determined for each of the indicators. Defense Medical Regulating Information System (DMRIS) records were reviewed to obtain patients' demographic data. Correlations between diagnoses and adverse clinical outcomes were evaluated. During AE missions the adverse clinical outcome rate was 0.9 per 1000 patients. Unanticipated need for O2 and development of chest pain in flight accounted for 73 percent of the in-flight adverse outcomes and occurred primarily in cardiac patients. The process discrepancy rate was 10 per 1000 patients - 10 times the adverse outcome rate. For patients remaining over night in Aeromedical Staging Facilities the adverse outcome rate was 2.9 per 1000 patients. ENT barotrauma accounted for 66 percent of these patients. The adverse clinical outcome rate for peacetime AE patients is very low. Patients with limited cardiopulmonary reserve are at higher risk during AE. During wartime and military operations other than war, AE patients are more likely to have limited cardiopulmonary reserve and be at higher risk due to injuries, malnutrition, or limited medical care prior to flight. Special attention to oxygen requirements, altitude restrictions, complete documentation of care required en route, and proper selection of medical attendants are crucial for good outcomes in AE.

MULTISPECTRAL IMAGE CORRELATION FOR AIR-TO-GROUND TARGETING

Ditzler, W. R., Naval Air Warfare Center, USA; Boyd, M. J., Naval Air Warfare Center, USA; Corcoran, T. J., Naval Air Warfare Center, USA; Franklin, M. S., Naval Air Warfare Center, USA; McKnight, J. E., Naval Air Warfare Center, USA; Ottenhoff, H. C., Naval Air Warfare Center, USA; Tyhurst, R. W., Naval Air Warfare Center, USA; Wirtz, M. M., Naval Air Warfare Center, USA; AGARD, Low-Level and Nap-of-the-Earth (NOE) Night Operations; Jan 1, 1995, 12 p; In English; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

A primary cause of failure in tactical air-to-ground missions is the the aircrew fails to find the assigned target. This is the case even for the aircrew against preassigned, large, stationary targets, such as bridges, supply depots, and air-defense sites, for which reconnaissance and satellite images of the target and its surroundings are available for the mission planning process. An important reason for this poor performance is the limited time available for target acquisition, especially when target defenses necessitate low-level ingress. During the time a target is visible to aircraft sensors, the aircraft is also visible to the target's defense systems. The time required for air-to-ground targeting with present systems (for example, to lock a targeting FLIR onto an airpoint is comparable to the response time of air defense systems. Clearly, minimizing the time needed to find and recognize targets is crucial for making attack missions more survivable. Survivability is enhanced if the attack mission can be carried out without the need to 'pop up' to use a targeting sensor. In a typical low-level attack mission, 8-10 s is available for the targeting process, from appearance of the target to weapon release. However, a pilot cannot remove his attention from flying the aircraft for this length of time, especially at night using night-vision systems. Pilots who have tested night-vision systems for low-level flight estimate that 1.5-2.0 s is the maximum allowable time to concentrate on a head-down display under these conditions. A near-term solution to the targeting problem must let the human operator make the final decision. The system described in this paper automates the search for the target (or an offset airpoint) by sending video from one or more of the aircraft sensors to an image correlator. The correlator finds the best match to an image of the target area, supplied from mission planning data, and displays the resulting target position overlaid on the sensor image. The aircrew is required to look at a head-down display only long enough to confirm of deny the correlator's result. The correlator can then automate the process of locking an image missile seeker onto target.

SIRPH: STEERABLE INFRARED PICTURE ON HELMET MOUNTED DISPLAY

Balzarotti, Giorgio, Fabbrica Italiana Apparecchiature Radioelettriche S.p.A., Italy; Fiori, Lorenzo, Fabbrica Italiana Apparecchiature Radioelettriche S.p.A., Italy; Midollini, Beatrice, Fabbrica Italiana Apparecchiature Radioelettriche S.p.A., Italy; AGARD, Low-Level and Nap-of-the-Earth (NOE) Night Operations; Jan 1, 1995, 10 p; In English; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Helmet Mounted Displays (HMD's) are being paid remarkable attention as an essential aid to pilots of both fixed and rotary wing aircraft. The technological improvements such equipment are experiencing place them in an outstanding position among avionics. A very important role in the success of HMD's is played by the management of man-machine-interface aspects: The way to make the information available, in a useful format, to the pilot must be considered with particular care. A smart example is the presentation of images from steerable sensors: The head tracking systems have actually achieved a high degree of accuracy, thus allowing a precise control of the Line of Sight (LOS) of electrooptical vision systems. Therefore, pictures generated by a steerable infrared sensor slaved to the pilot's head movements can be displayed onto the helmet visor, in order to provide the pilot with a substantial aid in day and night, adverse weather conditions, high altitudes down to low level and nap of the earth flight operations. The paper describes the results of a technical analysis performed on a system based on a steerable IR sensor integrated with an advanced HMD for navigation aid purposes. The parameters which lead to an imperfect static or dynamic overlay of the generated IR picture with the external world, as seen by the pilot through the helmet visors, and the effects of such misalignment are analyzed in detail, together with integration aspects and human engineering factors. The analysis has also taken into account the finite angular excursion of the IR sensor LOS, originated by gimbals limits, and the consequent necessary transition to and from the LLTV's integrated within the helmet, suitable to cover all possible head motions, has been investigated. An approach to the problem of the fusion of information generated by the IR sensor and the LLTV's is also reported. Finally, the paper highlights the limits and the constraints of navigation using a steerable IR sensor, with respect to safety aspects.

There are discussed the influence of some typical for the modern vehicles features (high frequency phase delay and nonlinearities in flight control system (FCS)) and parameters of input spectral density corresponding to the real piloting tasks on pilot response characteristics. There are developed some new standard characteristics the optimal aircraft dynamics and discomfort frequency response, and demonstrated their efficiency for the several applied tasks in design of FCS and development of requirements to the handling qualities. There are discussed the ways for suppression of pilot limitation parameters and FCS nonlinear and phase delay effects.

Report No.(s): AGARD-LS-202; ISBN 92-836-0016-9; Copyright Waived; Avail: CASI; A07, Hardcopy; A02, Microfiche

A new class of fighter aircraft is emerging that will be operational or in advanced Test and Evaluation (T&E) by 1995. These aircraft (e.g. MiG 31, YF-22, Eurofighter, Rafale) are capable of developing G far in excess of 9G (i.e. 12G will be a realistic capability). The operational envelope of these agile aircraft will depend upon the G protection provided to the aircrew. In response to this challenge, established and new laboratories using human-use centrifuges are developing new aircrew protection methods. These laboratories include Armstrong Laboratory (US), SAM (UK), DCIEM (CA), LAMAS (FR), SAM (RU), KONIGSBRUCK Laboratory (GE) and FOA Laboratory (SW). In 1995, much of this research will have produced prototype flight-worthy equipment/methods with advanced understanding of their physiological bases. This lecture series reviews (1) pathophysiology of high sustained G (9G and above) and (2) recent equipment development and reports on T&E.

Our major objective is to protect the aircrew against the detrimental effects of +Gz by developing and assessing equipment and techniques to enhance high sustained acceleration (+Gz) tolerance, and minimize the hazards of G-LOC. The payoff is reduced pilot fatigue and improved combat effectiveness. To accomplish these objectives it is imperative that we learn as much as possible regarding acceleration physiology and the influence that protective equipment and techniques have on acceleration physiology.

POSITIVE PRESSURE BREATHING FOR G PROTECTION (PBG)

Prior, A. R. J., Royal Air Force Inst. of Aviation Medicine, UK; AGARD, Current Concepts on G-Protection Research and Development; May 1, 1995, 16 p; In English; See also 19950027629; Copyright; Avail: CASI; A03, Hardcopy; A02, Microfiche

Modern, high performance, combat aircraft are capable of high sustained +Gz acceleration, at high G onset rates, for which enhanced G protection of the pilot is required if the performance of the aircraft is not to be limited by the capabilities of the pilot. Given that the pilot is essentially seated upright in the cockpit, the most suitable system of enhanced G protection is that of positive pressure breathing (PBG) with the possible addition of new anti-G trousers having considerably greater bladder coverage than previous garments. PBG used with in-service anti-G trousers reduces pilot fatigue and doubles G endurance. An anti-G straining maneuver (AGSM) is still required as the relaxed G tolerance of the pilot is increased by only 1G. PBG used with full or extended coverage anti-G trousers enables the pilot to tolerate 8G without needing to employ the AGSM and provides a high degree of protection against G-induced loss of consciousness. However, the increased bladder coverage of the trousers, and that of the chest counterpressure garment which is probably required for PBG, imposes a higher heat load on the pilot and has a tendency to reduce mobility. In addition, the oxygen mask must be capable of effecting an adequate seal of the PBG pressure against the face without user intervention; furthermore the system must be compatible with helmets containing display and sighting systems and be capable of use with NBC protec-

tive systems. Development PBG systems have yet to be fully optimized and their routine use by aircrew requires further assessment particularly with regard to the longer term consequences.

G-PROTECTION CAPABILITIES AND CURRENT G-PROTECTION ISSUES

Burns, J. W., Department of the Air Force, USA; AGARD, Current Concepts on G-Protection Research and Development; May 1, 1995, 8 p; In English; See also 19950027629; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

Acceleration tolerance and protection of female pilots, relationship between time away from +Gz exposure (G-layoff) and a reduced G tolerance, and +Gz-induced loss of consciousness (G-LOC) are discussed. G tolerance and endurance capabilities are reflections of the pilot's strength. While within gender there is a poor correlation (average 0.2) between body size and strength, males as a group are significantly stronger than females. Current +Gz protective equipment has been designed using male anthropometry. Two modifications were made to the anti-G suit to provide a better fit for female pilots: (1) a V-shaped dart in the lumbar restraint material to bring the suit in at the waist and (2) a lowered upper edge of the abdominal bladder below the rib cage in the seated position. Anecdotal information suggests a positive relationship between G-layoff and reduced G tolerance. The reduced endurance observed in this study may reflect the reduced +Gz tolerance reported to follow G-layoff, but they are not related to changes in aerobic or anaerobic metabolism, or relaxed responses to +Gz. The anti-G straining maneuver (AGSM) is a major factor in the maintenance of vision and consciousness for most pilots during high levels of +Gz. G-LOC is unique to the flight maneuvering environment in that it occurs in healthy aircrew. It is insidiously dangerous because it can happen with little or no warning. Cessation of cerebral blood flow, kinetics and secondary characteristics, and convulsions during G-LOC are discussed.

ADVANCED OXYGEN SYSTEMS FOR AIRCRAFT SYSTEMES D'OXYGENE AVANCES

Ernsting, John, Editor, Royal Air Force, UK; Miller, Richard L., Editor, Armstrong Lab., USA; Apr. 1996; 112p; In English
Report No.(s): AGARD-AG-286; ISBN 92-836-1033-4; Copyright Waived; Avail: CASI; A06, Hardcopy; A02, Microfiche

Many of the oxygen systems fitted to present NATO aircraft are unsatisfactory as they employ liquid oxygen which requires a complex and expensive supply chain, they impose undesirable physiological loads on the aircrew, particularly high resistance to breathing, and they do not provide pressure breathing with +Gz or effective protection to the respiratory tract and eyes against NBC agents. Advanced Oxygen Systems (AOS), which provide on board generation of breathing gas, impose a low physiological load on the aircrew and provide pressure breathing with G and at high altitude and protection against NBC agents, are required in the new generation of very agile high performance combat aircraft now under development by the NATO nations. This monograph provides a comprehensive review of the present state of development of AOS for combat aircraft and provides practical guidelines for the future development of these systems. The monograph comprises an introduction; conventional US and UK oxygen systems and their deficiencies; the history of development of on-board oxygen generating systems, OBOGS; operational requirements and design of AOS; physiological requirements for AOS; molecular sieves, pressure swing adsorption and oxygen concentrators; breathing gas regulators and masks for AOS; current molecular sieve oxygen generation systems; sensors, indicators and controls for AOS; practical aspects of design of AOS; and effects of contaminants, including chemical warfare agents, on molecular sieve oxygen generators; and

an index. This monograph will be of value to all those concerned with the design, procurement and operational use of Advanced Oxygen Systems to be fitted to future high performance combat aircraft.

DESIGNING NOVEL HEAD-UP DISPLAYS TO PROMOTE SITUATIONAL AWARENESS

Hardiman, T. D., Defence Research Agency, Farnborough, UK; Dudfield, H. J., Defence Research Agency, Farnborough, UK; Selcon, S. J., Defence Research Agency, Farnborough, UK; Smith, F. J., Defence Research Agency, Farnborough, UK; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 15-1 - 15-7; In English; See also 19960023107; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper considers the design of attitude symbology for Head-Up Displays and describes two experimental studies conducted at DRA Farnborough. In these studies, novel and current HUD formats were compared in a range of tasks requiring attitude awareness. Both studies compared the novel formats in a fixed-based simulator using a 'recovery from unusual position' flight task and task-performance was measured. The trials differed in terms of the 'design driver' data taken. The first used workload ratings (NASA Task Load Index) and the second situational awareness (SA) ratings (Situational Awareness Rating Technique). Significant reaction time differences were found between the conditions in both studies. However, although these significant differences were supported by the SA ratings they were not reflected in the workload ratings. It is suggested that under certain trial conditions SA is a superior design driver to measure than workload, since workload does not include cognitive aspects of pilot performance such as prior knowledge and understanding.

SCENE-LINKED SYMBOLOGY TO IMPROVE SITUATION AWARENESS

McCann, Robert S., NASA Ames Research Center, USA; Foyle, David C., NASA Ames Research Center, USA; Situation Awareness: Limitations and Enhancement in the Aviation Environment; Jan. 1996, 16-1 - 16-11; In English; See also 19960023107; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

This paper reviews recent research conducted in the Flight Management and Human Factors Division of NASA Ames Research Center on superimposed symbology (as found on HUDs and HMDs). We first identify various performance problems which suggest that superimposed symbology impairs pilots' ability to maintain simultaneous awareness of instrument information and information in the forward visual scene. Results of experiments supporting an attentional account of the impairment are reported. A design solution involving the concept of 'scene-linked' symbology is developed, and experiments testing the design solution are reported. An application of the scene-linking concept, in the form of a candidate HUD to support ground taxi operations for civil transport, is described.

ANTHROPOMORPHIC DUMMIES FOR CRASH AND ESCAPE SYSTEM TESTING MANNEQUINS ANTHROPOMETRIQUES UTILISES LORS DES TESTS D'IMPACT ET D'EJECTION

Jul. 1996; 120p; In English
Report No.(s): AGARD-AR-330; ISBN 92-836-1039-3; Copyright Waived; Avail: CASI; A06, Hardcopy; A02, Microfiche

Anthropomorphic dummies for crash and escape system testing have been used by military and civilian agencies for many years to assess, develop and standardize safer occupant restraint systems for land and air vehicles. The automotive industry has spent considerable effort in designing crash test dummies that are biofidelic; i.e., dummies

that duplicate the properties of a representative human subject on which injury risk is to be assessed. This advisory report addresses the status and direction of the technology of aircraft ejection and automotive crash test dummies from the point of view of the following: historical review of important dummies developed in NATO; human biomechanical response requirements of current adult dummies; anthropometry of current adult dummies; injury tolerance criteria for impact exposure of these dummies; dummy instrumentation and data acquisition systems; new developments in dummies; mathematical models as human surrogates; and dummy users in NATO. Recommendations include the need for the following: relating aircraft system effectiveness testing to dummy injury criteria; full line of dummy sizes to accommodate entire flying population; enhanced dummy instrumentation and data acquisition systems; affordability of dummy acquisition, use and maintenance; and validation and increased use of mathematical models as human surrogates.

ASSESSMENT OF ANTHROPOMETRIC ACCOMMODATION IN AIRCRAFT COCKPITS AND PILOT BODY SIZE SELECTION CRITERIA

Zehner, Gregory F., Armstrong Lab., USA; Selection and Training Advances in Aviation; Nov. 1996; 6p; In English; See also 19970012387; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Designing high-performance aircraft cockpits to accommodate the wide range of body sizes existing in the US population has always been a difficult problem for Crewstation Engineers. To alleviate this problem, the US Air Force restricts the range of body sizes allowed into flight training, and then develops aircraft design standards and specifications around that reduced population. Limiting the size of the aircraft crewstation (and, therefore, the aircraft) should also reduce the cost and improve the performance of the aircraft.

Under contract by the Royal Netherlands Navy an exploratory study was conducted on the design of the user interface for Maritime Unmanned Air Vehicles (MUVs) control. The goal of this study was to gain more insight into the various parameters that may influence system performance, given the present level of technology. Two simu-

lator experiments were conducted. Results of a first experiment made clear that the image transmission rate of the downlink is a critical factor. It appeared that with a single MUAV, only combined sensor and airframe control leads to an acceptable tracking performance, in particular at short observation distances. For low sensor image update frequencies (less than 4 Hz), tracking becomes critical. Results of a second experiment revealed that the tracking performance in a MUAV supervisory control task is identical to the first experiment, even in high auditive/cognitive workload conditions. It is suggested to focus further research on ways to improve operator performance and awareness at low downlink transmission rates. This can be affected by integrating synthetic information on orientation and MUAV status into the sensor image.

Rotorcraft-pilot coupling (RPC) has become a critical issue for flight safety. Based on experience in the field of aircraft-pilot coupling (APC), definitions and limited prediction opportunities of three RPC categories are discussed. Time delay, rate-limiting elements and pilot manipulators of full-authority FBW/L flight control systems provide new potentials of unfavorable rotorcraft-pilot coupling phenomena. Some limited RPC flight test experience at AFDD and DLR is presented. Research requirements for soliciting RPV prevention methodologies and technologies are laid down. New flight test techniques prediction tools and advanced technologies are proposed to improve RPC immunity.

IMPAIRED NOISE-ATTENUATION OF AIRCREW HELMETS AND HEADSETS FOR COCKPIT PERSONNEL WHO WEAR GLASSES

Rose, D.-M., Mainz Univ., Germany; Welsch, H., Institute of Aviation Medicine, Germany; Pongratz, H., Institute of Aviation Medicine, Germany; Konietzko, J., Mainz Univ., Germany; Jun. 1997; 4p; In English; See also 19970026380; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

Goggles significantly reduce the noise attenuation provided by hearing protection. The alteration of noise attenuation in 3 different helmets and one headset with 4 different spectacles was the object of this investigation. Sound pressure levels were measured inside the auditory canals of 11 candidates who were exposed to pink noise of 104 dB(lin) SPL with and without wearing the different types of spectacles and helmets. The mean noise attenuation of the headset and the helmet No 1 with separate ear-cuffs (SPH-4) was reduced in the mean up to 6 dB by glasses with thick horn-rimmed frames and less by glasses with thin metal frames. Helmets No 2 and No 3 (HGU-55 and an integrated helmet) provided only poor noise protection, but there was no further reduction of noise attenuation by wearing glasses. Headsets and helmets with separate ear-cuffs provided good noise protection. The reduction of noise attenuation with spectacles is significant depending on the thickness of the ear-piece. Thick horn-rims could potentially increase the risk of hearing impairment. If noise attenuation values are already poor (integrated helmet) glasses will not change the values much. to avoid hearing damage, only spectacles with thin frames should be worn by aircrews. In addition the visual field will also be enlarged.

THE APPLICATION OF A PROPRIETARY SOUND-ATTENUATING TECHNOLOGY TO PASSIVE CIRCUMAUROURAL HEARING PROTECTOR DESIGN

Thomas, G. B., Naval Aerospace Medical Research Lab., USA; Maxwell, D. W., Naval Aerospace Medical Research Lab., USA; VanDyke, P. R., Naval Aerospace Medical Research Lab., USA; Jun. 1997; 6p; In English; See also 19970026380; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The USA Navy recently patented (U.S. Patent #5,400,296 296) a composite technology that significantly improves a base materials ability to attenuate acoustical energy, particularly low-frequency acoustical energy. Given our success in applying the technology to components used by the transportation industry, we decided to investigate the feasibility of applying the technology to materials useful in the fabrication of circumaural hearing protectors. The proprietary technology is based on maximizing characteristic acoustic impedance differences between the constituents of the composite material. Because each base material used in the construction of the various components comprising a circumaural earcup assembly generally possesses a different inherent characteristic acoustic impedance, specific composite formulas had to be derived for each component material. That is, empirically derived formulas were required for the earcup shell material (i.e., epoxy resin), the ear seal material (i.e., silicone rubber), the ear seal filler (i.e., silicone gel), and requisite adhesives (i.e., silicone sealers). Hearing protector components were fabricated, then modified if necessary, based on results from flat plate coupler tests. Concentrating on noise frequencies below 125 Hz, we were able to fabricate earcup components that were generally superior in noise attenuation to those currently in standard use. In some instances, performance on the flat plate coupler yielded attenuation gains (relative to standard issue hearing protectors) of about 20 dB (at 31.5 Hz, for example). Gains on human models below 125 Hz are in the 9-15 dB range. The weak link in the earcup assembly remains the

traditionally problematical car seal (and the inverse relationship between noise-attenuation effectiveness and user comfort and acceptance). New materials and designs are being investigated to optimize this component.

The U.S. Army aviator works in high levels of noise and routinely faces the challenge of effective voice communication. Existing aviator helmets, while adequate in providing hearing protection, do not provide the signal-to-noise ratio necessary to optimize in-flight voice communications. The Communications Earplug (CEP) is a small device worn by the aviator and provides significant improvements in hearing protection and communication performance. The CEP uses a miniature earphone transducer adapted to a replaceable foam earplug. Attenuation characteristics of the CEP are similar to those of other insert hearing protective devices and provide adequate protection in U.S. Army noise environments. Additional protection results when the CEP is worn with the aviator's helmet. The CEP is comfortable over a period of several hours and, in its current configuration, is considered highly acceptable by seasoned aviators and crewmembers. The CEP is easier to insert and seat in the outer ear canal than other insert protectors available through military channels. Speech intelligibility in simulated helicopter noise is significantly enhanced when using the CEP when compared to the standard SPH-4 and HGU-56/P aviator's helmets. CEP and active noise reduction (ANR) results are comparable in terms of speech intelligibility. However, there are several differences that should be considered before deciding which is the system of choice. The technology developed for CEP has wide-ranging application in the military and can easily be adapted to communication needs in the civilian community. The CEP is an inexpensive device that can enhance air and ground crewmember voice communications in the operational environment, and should be positively considered for inclusion into all aircraft and vehicular communication helmets as a battlefield multiplier for the 21st century.

Active Noise Reduction (ANR) systems built into personally worn headsets and helmets, when properly designed and carefully fitted, have shown considerable potential for reducing noise exposure and improving the listening conditions under which auditory tasks are carried out in military operations. Performance limitations have been identified in certain devices, however. Some have a tendency to overload easily or to cease operating under adverse conditions, and others become unstable when the seal around the ear is broken. Recent findings indicate strongly that proper fitting around the ear is a functional necessity for satisfactory ANR operation. This is particularly true of units having a low tolerance to overloading and those which continue to operate in the infrasound frequency range. As a consequence, the function of any ANR system must be understood within the context of its intended operating environment in order to estimate whether the system will perform satisfactorily.

Hearing protection offered by current pilot helmets is far to be fully satisfying as shown by the large number of hearing losses observed in military aviators at retirement age. Due to the poor intelligibility of communication channels the sound volume has to be significantly increased which adds a dangerous auditory stressor. Eight hearing protectors such as commercially available active noise reduction (ANR) headsets and prototype helmets, equipped with ANR earshells, were assessed in order to estimate their efficacy for both noise attenuation and improvement on speech intelligibility. The assessment was based on original experimental protocols including abnormal conditions, objective measurement of both passive and active attenuations by the MIRE method, subjective prediction of intelligibility by measuring the Speech Transmission Index, and its subjective evaluation through CVC tests. Realistic jet and helicopter noisy environments and a pink noise have been used to perform the tests. The results obtained with the various systems assessed are presented and discussed.

Active noise reduction is a successful addition to passive eardefenders for improvement of the sound attenuation at low frequencies. Assessment methods are discussed, focused on subjective and objective attenuation measurements, stability, and on high noise level applications. Active noise reduction systems are suitable for integration with an intercom. For this purpose the intelligibility in combination with environmental noise is evaluated. Development of a system includes the acoustical design, the feedback amplifier, and the speech input facility. An example of such a development is discussed. Finally the performance of some commercial systems and a laboratory prototype are compared.

The feasibility of applying adaptive active noise reduction (ANR) to a communication headset has been explored by applying digital feedforward control to a headset designed for helicopter aircrew. A miniature microphone was mounted on the outside of one circumaural earmuff to provide a reference signal, while the original microphone and earphone located within the volume enclosed by the earcup of a commercial ANR headset were retained to provide an 'error' signal and the corrective sound field, respectively. The signals were digitized and processed in real time by a TMS320C31 digital signal processor

operating at 40 MHz. The performance of the apparatus has been evaluated in a reverberant room using a recording of Sea King helicopter noise at the aircrew position. The noise was replayed so as to reproduce the sound pressure levels measured in the helicopter during hover. Both noise spectrum and level were confirmed by one-third octaveband analysis. For active control, the helicopter noise was band-limited to from 10 to 1000 Hz. When tested on five subjects, the apparatus controlled the noise at the ear within this frequency range, and the control system was stable. The noise reduction recorded at the error microphone, i.e., close to the ear canal entrance, was in excess of 10 dB from 16 to 300 Hz for all subjects, and ranged from 10 to 26 dB at the rotor blade passage frequency (16 Hz), and from 10 to 20 dB at frequencies up to 200 Hz, depending on the subject. The differences in ANR experienced by the subjects are believed to be associated with variations in the fit of the headset, and remain the subject of continuing research.

EFFECTS OF ACTIVE NOISE REDUCTION IN ARMOR CREW HEADSETS

Anderson, B. Wayne, Army Research Lab., USA; Garinther, Georges R., Army Research Lab., USA; Jun. 1997; 6p; In English; See also 19970026380; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The armor environment, like that of aviation, makes communication difficult and often produces a hearing loss in the crewmembers. In an attempt to improve this situation, the Army is presently fielding tankers' helmets with Active Noise Reduction (ANR) as a part of the Vehicular Intercommunications System (VIS). A number of studies were conducted to evaluate the effectiveness of ANR for the armor environment. In-the-ear noise level measures were done and speech intelligibility tests conducted. For armored vehicles producing noise levels of 114 dB(A), these helmets reduce the noise at the ear to 83 dB(A) when the intercommunication system is not keyed, 90 dB(A) when the system is keyed, and 94 dB(A) when the system is keyed with a person talking over the system. This is an improvement in noise reduction of about 17 dB(A) compared to the helmets presently being used. This improved noise attenuation has increased speech intelligibility from 68% to 89%. According to previous studies, such an improvement can be equated to a 25% increase in successfully accomplished armor missions. Incorporation of ANR into these helmets has increased low frequency attenuation by up to 13 dB above the passive attenuation of these helmets. At frequencies greater than 800 Hz, ANR does not provide any additional attenuation above the passive attenuation. The attenuation produced by these new helmets has increased the allowable daily exposure time in armored vehicles from 20 minutes to 12 hours.

The growth of Active Noise Reduction (ANR) headset technology has accelerated over the past five years. The applications for normal hearing listeners are extensive and the potential for use by persons with hearing loss is excellent. The primary goal of ANR headsets is to reduce the level of the noise at the ears thereby reducing the probability of noise induced effects on hearing and on voice communications. In November 1995, a specially modified ANR headset was demonstrated for users with varying degrees of hearing loss. Most ANR headset systems in operation today are used in aviation associated applications where many of the users have mild to moderate

hearing loss. This paper describes the sound attenuation and speech communications performance of both normal and modified ANR headset technology with both normal and hearing impaired users. The limitations and advantages are discussed as well as what can be expected from both standard and modified ANR headset systems.

ACTIVE NOISE REDUCTION FLIGHT TESTS IN MILITARY HELICOPTERS

Simpson, Carol, Psycho-Linguistic Research Associates, USA; King, Robert, Defence Science and Technology Organisation, Australia; Jun. 1997; 18p; In English; See also 19970026380; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

US Army Aeroflightdynamics Directorate (AFDD), in collaboration with AS Aeronautical and Maritime Research Laboratory (AMRL), has conducted flight tests in a range of military helicopters to determine the potential benefit of active noise reduction (ANR) earcups developed by the UK's Defense Research Agency (DRA) for military aircrew. Test data include (a) acoustic attenuation characteristics, (b) speech intelligibility, (c) aircrew ratings of cockpit speech intelligibility, clarity, and attention demand for speech message recognition, and (d) ratings of the suitability of ANR for operational use. Test aircraft in which data were collected include American NAH-1S (Cobra), UH-1H (Huey), OH-58D (Kiowa), AH-64A (Apache), EH-60 (Blackhawk), and Australian S-70B-2 (Seahawk) and S-70A-9 (Black Hawk). Results show that the DRA ANR system effectively reduced the level of low frequency noise (less than 800 Hz) and reduced overall at-ear sound pressure levels (SPL's) by around 10 dB. Results also indicate that ANR substantially increases speech intelligibility, reduces the level of attention pilots must use to understand speech communications, works with onboard weapons firing noise, allows pilots to hear familiar audio cues necessary for aircraft situational awareness, and functions without failure in training and actual combat conditions. With the DRA ANR system, speech intelligibility meets the exceptionally high intelligibility criteria as defined in MIL-STD 1472 for operational systems, providing the speech intelligibility needed to ensure that pilots and soldiers communicate tactical information accurately.

Active techniques for attenuating the sound pressure levels at the ears of aircrew are examined. Conventional Active Noise Reduction (ANR) systems are reviewed. Their performance is shown to be constrained by their essential 'feedback' architecture. ANR systems which avoid the feedback path are introduced and the performance of a new active noise reduction system is reported. The new system is demonstrated to offer such attenuation of noise that hearing damage risk is significantly reduced and operational performance enhanced.

Except for being hazardous to the function of the ear itself, noise has a lot of unpleasant non-organic capabilities. It is annoying, noise interferes with performance and efficiency, and it interferes with

communication. No matter what we do, we all have to live with and accept certain levels of noise. This, indeed, counts for aviation too. It has been told, that when Louis Blériot in 1909 flew from France to England, the noise from his 25 HP engine heard from the ground by those fortunate enough to witness this historic event, was probably 20 to 30 dB louder than the noise reaching the ground from a current jet aircraft. This was caused by the fact that Blériot flew very much lower than modern aircraft. So, due to simple physical laws, the closer you are to a noise source, the more you are exposed, and those closest to an aircraft are those working in it or outside the plane. In the air force and in other flying units of our defense, personnel is exposed to high levels of noise. The purpose of the present study, is simply to map, in a comparable way the noise impact on personnel working at different positions in relation to aircraft used by the Danish defense - to establish the efficiency of different noise protection devices used by personnel working at different positions - and finally to advise the proper authorities concerning the proper use of noise protection devices in order to avoid as much as possible the harmful effects of aircraft noise as described above.

A GENERIC ARCHITECTURE FOR CREW ASSISTANT SYSTEMS
Urlings, Pierre J. M., Defence Science and Technology Organisation, Australia; Zuidgeest, Rene G., National Aerospace Lab., Netherlands; Jul. 1997; 12p; In English; See also 19970029347; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

A crew assistant is an on-board automated system that supports an aircraft crew in performing its tasks. Aircraft crews are currently confronted with numerous displays and complex controls in their cockpit. An overwhelming amount of multi-source data is offered while simultaneously control over the aircraft and its systems has to be maintained. This may lead to situations of high workload in which non-optimal decisions are made. Crew assistant systems are planned to reduce this problem and hence improve efficiency and flight safety. They are expected to rely heavily on Advanced Information Processing (AIP) technologies to organize data and control flow in such a way that the crew is provided with concise and relevant information. At the same time the crew's control efforts will be considerably reduced. This will enable the crew to concentrate on essentials and to make decisions more effective. Several developments exist in this area. Pioneer programmes are the US 'Pilot's Associate' the British 'Mission Management Aid' the French 'Copilote Electronique' and the German 'Cockpit Assistant System.' These programs go by different names but all aim at the automation of routine tasks and the provision of effective aids to the crew problem solving and task management. The architectures developed in these programmes have many elements in common but suggest a more generic architecture. Another common element of these programmes is that they consider AIP as key technology for their successful implementation. AIP provides technologies able to handle the complex interaction between crew, crew assistant, aircraft systems and sensors. This paper focuses in particular on these two aspects: a generic crew assistant architecture and the application of AIP technology. In section 2 the operational environment is described in which a crew assistant is to be embedded. Section 3 introduces a generic crew assistant architecture which is independent of any type of aircraft or operation. Section 4 proposes the application of AIP in general and of multi-agent systems in particular as a key technology for successful implementation of a crew assistant. Throughout the paper, the crew assistant is illustrated by an application of a single-pilot military aircraft, but the concept is also relevant to multi-crew or civil aircraft.

Due to increasing demands put on crews of military aircraft, effective cockpit systems will be required in order to reduce workload and to improve crew performance. This paper presents various approaches to crew assistance in tactical flight missions. The underlying tasks are tactical decision making, low-level flight planning and flight guidance. The integration of the Tactical Situation System as part of a knowledge based crew assistant and a flight guidance display system incorporating sensor and synthetic vision components offer a promising solution to improve the situational awareness of the crew. Respective prototypes have been successfully tested and evaluated in a simulated environment as well as by flight trials.

HEAD INJURY RISK IN US ARMY ROTARY-WING MISHAPS: CHANGES SINCE 1980

Shannon, Samuel G., Army Aeromedical Research Lab., USA; Albano, John P., Army Aeromedical Research Lab., USA; Licina, Joseph R., Army Aeromedical Research Lab., USA; Nov. 1997; 10p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Over the past several decades, data have been collected on U.S. Army aircraft mishaps defining the environment within an aircraft during a mishap, injuries suffered by the occupants, and the cause (or causes) of the mishap, if known. An analysis of these data indicates 60% of the occupants are injured, one-third fatally, if the mishap concludes with the aircraft impacting the ground. More significantly, despite improvements in helicopter design, restraint systems, and personal protective equipment, 68% of all fatalities had at least one fatal injury to the head. After adjusting for differences in mishaps, including the aircraft series, and the occupant's station within the aircraft, the authors concluded that an occupant's injury risk in a helicopter mishap had decreased significantly between 1980-84 and 1990-94. One factor in this was a decline in the risk of head injury, which declined by 50%. Injury risks to the face and brain, critical anatomical regions of the head, also showed a significant decline. Risks of injury to the neck, torso, and upper extremities were not significantly different between the two time intervals. Although the authors could not identify causative factors with clear implications for preventive strategies, the proportion of new, crashworthy helicopters in the U.S. Army fleet have risen steadily since 1980 and a new flyer's helmet with improved impact protection, the SPH-4B, was fielded by the U.S. Army in the 1990's.

STANDARDS FOR PROTECTIVE HELMETS

Glaister, D. H., Royal Air Force, UK; Nov. 1997; 4p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

Undoubtedly, the protection afforded by helmets for sporting activities, the workplace and the military has improved over the years, but at a somewhat modest pace. Many published reports attest to the benefits of helmet wear in most applications, but equally show that brain damage and death can still occur despite the wearing of approved headgear, and not always under conditions of massive 'unsurvivable' impact. A better understanding of the mechanics of brain injury, the continued application of accident data, the development of more appropriate helmet test methods and the availability of new materials, together with a growing public awareness of safety,

should allow the makers of standards to demand further improvements from helmet manufacturers and ensure a continuing fall in morbidity and death from head injury.

MASS REQUIREMENTS FOR HELICOPTER AIRCREW HELMETS

McEntire, B. Joseph, Army Aeromedical Research Lab., USA; Shanahan, Dennis F., Army Aeromedical Research Lab., USA; Nov. 1997; 6p; In English; See also 19980003879; Sponsored in part by Program Managers for Comanche; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Helicopter aircrew helmets are becoming more sophisticated with increased mission requirements. This increase results in additional mass being supported on the aircrew's head. Ultimately, there is a limit to how much mass can be supported by the aircrew without increasing the fatigue rates and neck injury risk in accidents. This paper reviews the past mass property requirements of Army helicopter helmets. Current requirements for the RAH-66 Comanche helmet are also detailed with the rationale for their derivation.

INFLATABLE RESTRAINT SYSTEMS FOR REDUCING HEAD INJURY

Zimmermann, Richard E., Simula, Inc., USA; Yaniv, Gershon, Simula, Inc., USA; Nov. 1997; 14p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Inflatable restraint systems, in the form of "air bags," are widely recognized as an effective means of reducing crash injury in automobiles. In order to provide similar crash injury protection in both commercial and military aircraft, a variety of inflatable restraint systems are now being developed. For commercial aircraft, the Passenger Air Bag System, (PABS) will provide protection for occupants in seats positioned behind bulkheads, galleys, or restrooms. The first application of PABS will be on the Jetstream J-41 aircraft. For military aircraft, a number of inflatable restraint systems are also being developed for the special conditions found in their crewstations. In addition to the Cockpit Air Bag System (CABS) that has similarities to automotive air bags, there is the Inflatable Body and Head Restraint System (IBAHRS) for use in some attack helicopters, and the Inflatable Tubular Structure (ITS) for use in small helicopters.

SIMULATIONS OF HEAD STRIKES IN HELICOPTERS AND THE ROLES OF RESTRAINTS, SEAT STROKE AND AIRBAGS ON THEIR REDUCTION

Alem, Nabih M., Army Aeromedical Research Lab., USA; Beale, David G., Auburn Univ., USA; Mobasher, Amir A., Universal Energy Systems, Inc., USA; Brozoski, Frederick T., Universal Energy Systems, Inc., USA; Nov. 1997; 8p; In English; See also 19980003879; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Injuries from head strikes remain the leading cause of fatalities in U.S. Army helicopter mishaps. The roles of the restraint system, energy absorbing seat stroke and airbags in preventing or reducing the severity of head strikes are explored in this paper using mathematical simulations. Starting with a baseline simulation of an actual AH-64 survivable mishap in which the pilot received fatal basilar skull injury, the effects of three parameters were examined: timing of inertia reel locking, stroking of the energy absorbing seat, and the presence of an airbag mounted at the instrument panel. Results of the simulations suggested that delay of inertia reel in locking at the appropriate time

together with obstruction of seat stroking may have caused the pilot's head to strike the glare shield. When a head strike was unavoidable, simulations indicated that an airbag would have reduced its severity.

Changes to the Federal Aviation Administration (FAA) regulation regarding occupant crash protection in commercial airplanes has created new design considerations for each occupant position. In particular, addressing front row seating positions to meet the head injury criteria can be a challenging design assignment involving numerous considerations. Various design approaches to meet this requirement are discussed. Particular attention is given to the articulating seat pan approach. Results of prototype testing are presented with recommendations regarding further development.

This paper describes the initial phases of an ongoing project in the GM Motorsports Safety Technology Research Program to investigate Indy car crashes using an on-board impact recorder as the primary data collection tool. The development of a database consisting of crash investigation data patterned after national highway crash databases is discussed. The data gathered and coded includes track and incident scene information, vehicle damage, and driver injuries, as well as the vehicle decelerations measured by the impact recorder. The paper discusses the development of specifications for the impact device, the selection of the specific recorder and its implementation on a routine basis in Indy car racing. The results from incidents that produced significant data during the 1993, 1994 and 1995 racing seasons are summarized.

A three dimensional Finite Element Model of an existing full-face motorcycle helmet mounted on a headform has been developed. Material parameters were obtained from literature data and from component tests. The model is validated by simulating impacts at different locations using the headform acceleration time histories. From this it can be concluded that the headform response is predicted in a realistic way. The simulations showed two phenomena that influence the headform response, i.e. the behaviour of the material between the headform and the point of impact, and the dynamic

response of the outer regions of the outer shell. It is believed that the current model describes most of the phenomena observed during an impact and, therefore, is suitable for future optimization studies. The application of the current model is limited to impacts on a flat anvil at points in the median plane of the headform. Recommendations for further model enhancements will be presented.

The challenge for future mission systems is to produce affordable solutions that provide the desired levels of operational effectiveness. This will be achieved by a system that enables the operator to be in ultimate control of the mission system through a manageable workload and an appropriate level of situational awareness. The crew interface is therefore vital to exploiting the full capabilities of the platform under control. The crew interface can be enhanced by the thoughtful application of technology. To be affordable however, the technology must be carefully matched with requirements. At all stages of the design, including research phases, consideration has to be given to a careful harmonisation of the capabilities of the human, the hardware and the software. To be effective, the design must evolve from the beginning through co-operation between the designers, the implementors and the users. Recognizing the benefits of extending this approach into the research phase, a collaboration has been established between British Aerospace Military Aircraft and Smiths Industries Aerospace to explore aspects of the crew interface for mission systems. This paper discusses the goals for an affordable and effective future mission system and the approach being taken to achieve these goals.

COCKPIT USABILITY - A DESIGN CHECKLIST

Turner, John, British Aerospace Defence Ltd., UK; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 1; 8p; In English; See also 19980033517; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

'Usability' represents the degree of help or hindrance provided to the pilot or crew member as they attempt to complete the operational

missions with which they may be tasked; it also acknowledges the financial/technological realities against which designs are developed. The factors which impact cockpit and system usability, some of the steps necessary to achieve it, and suggested items for inclusion in a usability design checklist are discussed.

Even after discovering the world was not flat, map makers were limited to representing our three-dimensional(3-D) world on a flat piece of paper. This was fine for small regions. For large regions, however, distortions became obvious; continents were misshapen, enlarged or shrunken. Like the earth, the human body is covered with ridges, hills and valleys and is anything but flat. Scientists attempting to map the body face the same difficulty with distortions that cartographers do. For engineering purposes, researchers measure the 3-D body, but until now they have used only one- or two-dimensional tools. They have been forced to change back and forth from 3-D to 2-D to create the products. This paper describes the design impact of the limitations with traditional tools for human body measurement and illustrates the future potential of 3-D surface anthropometry technology on the engineering of aerospace systems.

REDUCTION OF AIRCREW WORKLOAD THROUGH THE USE OF INS/GPS WHILE EMPLOYING STANDOFF WEAPONS

Stolz, Earl W., Flight Test Squadron (40th), USA; Kosan, Keith J., Flight Test Squadron (40th), USA; Dec. 1997; 12p; In English; See also 19980035004; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Modern fighter aircraft are capable of unprecedented attack accuracy. However, the risk associated with close-in delivery against well-defended targets is often high. As a result, current tactics call for delivery of precision-guided munitions from increased standoff ranges. The AGM-130 was designed to fill this need. The AGM-130 evolved from the GBU-15 family of glide bombs and is equipped with a rocket motor to increase standoff range. With the increase in launch ranges came an increased workload due to difficulty locating targets within the seeker's Field of View (FOV). A launch heading offset or crosswind could require the Weapon Systems Officer (WSO) to scan a large area to locate both the target itself and any required waypoints. The MidCourse Guidance (MCG) program is an enhancement designed to address this difficulty by decreasing workload with an autonomous guidance capability in the midcourse portion of the flight and the ability to point the seeker at the target. The objective of the AGM-130 MCG test program is to evaluate the benefits associated with reduction of aircrew workload with the introduction of an Inertial Navigation System (INS) that is position- and velocity-aided by the Global Positioning System (GPS). This paper will discuss flight test techniques and results obtained from the Phase I test program, which focused on initial integration efforts using profiles to attack vertical targets. Phase II will address the capability to attack horizontal targets and is currently being tested. A secondary objective of demonstrating the advantages of guidance using Wide Area GPS Enhancement (WAGE) corrections was also accomplished. Testing involved a series of ground functional tests, captive carries in which the aircraft flew the weapon's profile, and three live launches. The stated goal of the MCG program is to ensure that the target appears in the seeker's wide FOV at 15 seconds time-to-go 95% of the time. In all cases this criteria was met. Additionally, the target was within the narrow FOV 100% of the time. Using the Subjective Workload Assessment Technique (SWAT) in a head-to-head comparison with a non-MCG-guided AGM-130, a 25% reduction of WSO workload was demonstrated.

Subjective assessments of the value of the MCG modification were made using aircrew questionnaires and a modified Cooper-Harper Scale.

Man-machine system performance on target designation and tracking tasks can be influenced by the design of the manual control subsystem including characteristics of the control device. An experimental set-up simulates the control station of a human operator monitoring a computer display which shows the stabilized TV-camera view out of an unmanned aerial vehicle flying at low altitude. Using a hand-grip controlstick the operator can control the direction of the missile's camera to facilitate the designation of a target. After "lock on", further tracking of the target is made by an automatic tracking system. The operator has to monitor the tracker function and to make corrections if necessary. Target designation by the operator becomes a critical task because the camera system has a narrow field of view to enhance good recognition. Thus target images move towards display edges in a short time. So the target designation task has to be fast and reliable. To achieve near optimum operator performance three different types of control sticks are used and compared in an experiment: (1) a moveable stick (displacement), (2) a stiff stick (hybrid force), and (3) an unmoveable stick (pure force). Additionally the sensitivity, i.e. the gain of the control signal, is being varied including a non-linear relationship. Results of a test series conducted comparing linear and non-linear control gain showed no significant differences on performing the target acquisition task.

INTEGRATION OF TECHNOLOGIES FOR CLOSED COCKPITS

Timmers, H., Advisory Group for Aerospace Research and Development, France; Helps, K., Advisory Group for Aerospace Research and Development, France; Aerospace 2020; Sep. 1997; Volume 3, 78; In English; See also 19990014353; Copyright Waived; Avail: Issuing Activity; Abstract Only; Abstract Only

All future aerial missions are threatened by directed energy weapons (DEWS) or flash devices. The availability of rather inexpensive blinding flash devices can soon significantly hinder or even prevent the effective use of air power. In order to protect aircrews and enable them to successfully continue the mission the concept of closed cockpits will be an important means to overcome these threats. Processing capabilities which will be available in the near to midterm future make the realization of closed cockpits feasible. Still, the closed cockpit impose some severe problems which must be solved in order to maintain crew awareness under all circumstances and in all phases of flight. To name only a few of them, problems associated with synthetic vision, sensor displays and sensor integration or pilot interaction with all aircraft systems must be solved to make the closed cockpit concept operational viable. It must be proven, that sensors can be built, which work reliably under all conditions (including massive counter measures), that all available data can be fused together and that all these sensors can be integrated in a way to give results which can be trusted and effectively communicated to the aircrew. The realization of closed cockpits is a task, which requires contributions from many other technology fields, hence, it works as a technology driver also outside its direct field of application. The benefits of the closed cockpit will be the ability to perform aerial missions also in presence of a new class of threats successfully.

A DESIGNER'S GUIDE TO HUMAN PERFORMANCE MODELLING LA MODÉLISATION DES PERFORMANCES HUMAINES: MANUEL DU CONCEPTEUR

A Designer's Guide to Human Performance Modelling; December 1998; 170p; In English; See also 19990032480 through 19990032490 Report No.(s): AGARD-AR-356; ISBN 92-836-1077-6; Copyright Waived; Avail: CASI; A08, Hardcopy; A02, Microfiche

Working Group 22 was convened in 1995, jointly sponsored by the Aerospace Medical Panel and the Flight Vehicle Panel to investigate the use of Human Performance Models within the specification, procurement, design, qualification and certification of military systems. In particular the group focused on the selection, application and use of HPMS by the system designer. An expert system approach was selected to ensure that the designer considered all the relevant factors when selecting a new model or tool. This was implemented using a commercially available expert system shell. The user is asked to select options that most closely describe his resources and requirements and the Human Operator Modelling Expert Review (HOMER) then rank-orders the HPMS in its database and suggests the most appropriate model. The group carried out some walkthroughs of existing models/tools to demonstrate typical uses in the analysis of specific issues. These are included as case studies. These were included to give potential users some insight into the ease or complexity of use in order to evaluate the required aspect of human performance. In addition the group also considered the model developer community by examining the limitations of existing models, commercial implications and usability issues in order to guide any future development.

APPLICATION OF AN ANTHROPOMETRIC TOOL TO COCKPIT LAYOUT

Burrett, Gretchen, Defence Evaluation Research Agency, UK; A Designer's Guide to Human Performance Modelling; December 1998, A3-1 - A3-4; In English; See also 19990032479; Copyright Waived; Avail: CASI; A01, Hardcopy; A02, Microfiche

Anthropometric tools are used to assess human interaction with workplace layout in terms of fit, reach and vision. As humans do not come in a standard size, these tools address the range of potential users, from very small to very large. This paper provides an example of how Anthropometric tools can be used to help optimise cockpit layout. Jack(R) is used as an example tool.

HUMAN RELIABILITY ASSESSMENT TOOLS: PHRASE 2

Buck, Brian, GEC-Marconi Research Centre, UK; Burrett, Gretchen, GEC-Marconi Research Centre, UK; A Designer's Guide to Human Performance Modelling; December 1998, A4-1 - A4-5; In English; See also 19990032479; Copyright Waived; Avail: CASI; A01, Hardcopy; A02, Microfiche

Human Reliability Assessment (HRA) tools seek to quantify the likelihood of human error given that error mechanisms have been identified. They form an integral part of a larger process of Human Reliability Assessment. HRA has traditionally been used primarily in the process control industries, but some methods are appropriate to military applications. Its use requires skilled practitioners. HRA is not a substitute for detailed human factors assessment when the objective is to maximise human performance. However, it will assist in directing design and evaluation effort where the human contribution is most critical. This paper outlines how HRA tools can be applied to cockpit design and describes the HRA process. PHRASE 2 is used as an example tool.

19990032488 Micro Analysis and Design, Boulder, CO United States WORKED EXAMPLE OF THE USE OF WINCREW IN THE EVALUATION OF OVERALL SYSTEM PERFORMANCE

Laughery, R., Jr., Micro Analysis and Design, USA; A Designer's Guide to Human Performance Modelling; December 1998, A8-1 - A8-21; In English; See also 19990032479; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

WinCrew is a tool for constructing system performance models for existing or conceptual systems when a central issue is whether the humans and machine will be able to handle the workload. WinCrew can be used to predict operator workload for a crew given a design concept. WinCrew also has the ability to model and predict the effects of that workload on crew and system performance. What separates WinCrew from other workload models is this direct link between task-induced workload and the effect on system performance. With WinCrew, you can predict how the human will dynamically alter his behaviour when he or she encounters high workload situations. WinCrew can simulate the following as a function of high workload: dynamic allocation of tasks between humans, machines; dropping tasks based on task priority; and task time and accuracy degradation.

OPTICAL PROCESSING AND COMPUTING LE TRAITEMENT OPTIQUE DE DONNEES ET L'INFORMATIQUE

Sep 1, 1995; 147p; In English; In French; AGARD SPP Lecture Series on Optical Processing and Computing, 19-20 Oct. 1995, Paris, Rome, Ankara, France, Italy, Turkey; See also 19960008187 through 19960008191; Submitted for publication in AGARD-LS-199 Report No.(s): AGARD-LS-199; NIPS-95-06213; ISBN 92-836-0018-5; Avail: CASI; A07, Hardcopy; A02, Microfiche

Optical computing possesses some inherent advantages over electronic computing, in particular for massive data storage and parallel and neural processing. The main aim of this lecture is to show how recent advances in lightwave technology make the time ripe to consider exploiting the potential of optical computing for data processing applications. An overview is presented of the basic concepts and inherent advantages of using optics for data processing and computing applications. The use of optics for interconnecting electronic and optoelectronic processors and the use of optoelectronic techniques to enhance the performance of various computing devices and systems are discussed. An overview is given of the emerging field of artificial neural networks as a signal processing paradigm and their optical implementations. Recent developments in optoelectronic data communication are described.

IMPACT OF OPTICS ON COMPUTING SYSTEMS: FROM OPTICAL INTERCONNECTS TO DEDICATED OPTOELECTRONIC MACHINES

Chavel, Pierre, Centre National de la Recherche Scientifique, France; AGARD, Optical Processing and Computing; Sep 1, 1995, 12 p; In English; See also 19960008186; Avail: CASI; A03, Hardcopy; A02, Microfiche

In telecommunication systems, optics is now a pervasive technology. Its advantage of high communication throughput is relevant also to computing systems. However, eliciting the full benefit of optics will first require the development of techniques for integrating a large number of optical channels in a system and to understand the implication on computer architecture. We start with a review of the physical bases that justify the use of optics for implementing interconnect networks and, more generally, for designing future computing (as well as digital signal processing) systems. This analysis determines

the logical sequences of the following sections: optoelectronic technologies that are already available at present allow the demonstration of a number of functions and extrapolation to many others. One can envisage an evolutionary path and a revolutionary path. In the first case, optical functions are added to architectures that are otherwise determined by standard microelectronics concept; under this heading, we shall examine optical interconnect networks for computing systems with a relatively high degree of parallelism. The second path implies completely revisiting architectural concepts down to circuit design. Based on the concepts of 'smart pixels' and cellular automata, it suggests a number of ideas for dedicated processors applicable in particular to vision machines with massive parallelism. The computational power of current high-performance computers is increasingly limited by data storage and retrieval rates rather than the processing power of the central processing units. No single existing memory technology can combine the required fast access and large data capacity. Instead, a hierarchy of serial access memory devices has provided a performance continuum which allows a balanced system design. Conventional memory technology can only marginally support the needs of high performance computers in terms of required capacity, data rate, access times, and cost. Significant gaps in secondary and tertiary storage have emerged which make storage hierarchy design increasingly difficult. This paper reviews a radically different approach to data storage using the parallelism and three dimensionality of optical storage. Three-D optical storage has the potential to significantly alter the present hierarchy and fill the pressing need for high performance secondary and tertiary storage systems.

Lecture notes for the AGARD Fluid Dynamics Panel (FDP) Special Course on 'Parallel Computing in CFD' have been assembled in this report. The aim and scope of this Course was to present and discuss the latest advances and future trends in the application of parallel computing to solve computationally intensive problems in computational fluid dynamics (CFD). Topics in this lecture series focus on the increasingly sophisticated types of architectures now available, and how to exploit these architectures by appropriate algorithms for the simulation of fluid flow. Some of the subjects discussed are: parallel algorithms for computing compressible and incompressible flow; domain decomposition algorithms and partitioning techniques; and parallel algorithms for solving linear systems arising from the discretized partial differential equations.

SAGEM S.A. company presents an architecture for embedded recording of multiple video signals and digital data on a single tape, and their ground restitution. The System Emports Interface Box (BISE) is a hardened equipment, mounted on ACE/Rafale aircraft. It manages all interfaces between aircraft and stores, following the MIL-STD-1760 standard: digital buses, video signals and synchronisation/blanking signals. One of its function is to realize the time multiplexing and data marking of several video signals, for mission recording on magnetic tape. A ground PC-based equipment has been developed in parallel for the restitution of these video signals and data. Some data are used to synchronize the visualization of the video source chosen by the operator. The considered evolutions of this architecture are discussed, with digital video recording and restitution.

THE APPLICATION OF ADA AND FORMAL METHODS TO A SAFETY CRITICAL ENGINE CONTROL SYSTEM

Dolman, W. C., Lucas Electronics, UK; Ashdown, A. M., Lucas Electronics, UK; McCallion, K. J., Ministry of Defence, UK; AGARD, Dual Usage in Military and Commercial Technology in Guidance and Control; Mar 1, 1995, 13 p; In English; See also 19950026705; Copyright; Avail: CASI; A03, Hardcopy; A02, Microfiche

The procurement executive of the UK Ministry of Defense, MoD (PE) identified Ada as the single preferred high level language for the implementation of defense real time operational systems from 1 July 1987. This meant that projects selecting an implementation language after that time must select Ada, unless there are sound and documented reasons for using an alternative. MoD (PE) therefore decided to invite proposals for the High Order Language Demonstrator (HOLD) to examine the applicability of Ada to an aero gas turbine full authority digital engine control (FADEC), and awarded the contract to Lucas Electronics, Birmingham. This paper describes the work carried out by Lucas Electronics on this contract.

This article deals with the problem of making an early decision on the type of simulation to be used and eventual costs of the simulation program. The person in charge of the program wants to make conceptual decisions as late as possible, and the author says that simulation can greatly help in making these decisions. Three kinds of simulation are dealt with: technical-operational simulation at the gross level involving simple models and no human intervention; war game level simulation with human involvement and more complex models; and finally the most detailed simulator level, which includes human intervention and possible environmental factors. The author then discusses the role of the human operator in the various war game scenarios.

Though polygon and pixel capacity remain significant parameters of real time image generators, the visual aspect and the content's quality of the images take more and more importance with their utilization in NOE flight of helicopters, or combined arms simulation and interoperability context. In this field, APOGEE represents a breakthrough in real time image quality and complex scene content restitution. An improved management of the database guarantees the best restitution of the scene content accounting for the specific polygon and pixel capacity of one system. AZtec, the new algorithm developed by Sogitec for hidden part elimination and antialiasing, allows for processing of opaque, transparent, or lighting polygon participation, in any number and in any order. A nice rendering of complex scenes, regarding the lighting and shading aspect, is obtained without the sorting constraints encountered in similar systems, to process transparent faces at the end of the computation cycle. On the whole, the optimization and the integration of all stages of the APOGEE image computer, provide the best figures on all image generation criteria, and offer modularity in terms of performance and image definition.

Main market demands for the visual system of a simulator are photo-realism and low latency time. RTSS, a general purpose image generation module developed within the European ESPRIT project HAMLET, can meet these demands through the use of High Performance Computing technology. This technology provides the needed communication and computing power. Moreover, by using parallel processing, the whole system is scalable, i.e., the same software and hardware design can be used for small, cheap systems, as well as for high-end view simulations. This allows an easy adaptation to the user's needs. RTSS also includes an object and scenario editor implemented on a work station, as well as filters to other object data standards. This paper will give an introduction to the soft- and hardware design of RTSS. It will then present the features of the system as well as the interfaces the filters to import external model data and the interfaces to the simulation system itself.

A turbulence model has been developed for blade-element helicopter simulation. This model, called Simulation of Rotor Blade Element Turbulence (SORBET), uses an innovative temporal and geometrical distribution algorithm that preserves the statistical characteristics of the turbulence spectra over the rotor disc, while providing velocity components in real time to each of five blade-element stations along each of four blades. An initial investigation of SORBET has been performed using a piloted, motion-based simulation of the Sikorsky UH60A Black Hawk. Although only the vertical component of stochastic turbulence was used in this investigation, vertical turbulence components induce vehicle responses in all translational and rotational degrees of freedom of the helicopter. The single-degree-of-freedom configuration of SORBET was compared to a conventional full 6-degrees-of-freedom baseline configuration, where translational velocity inputs are superimposed at the vehicle center of gravity, and rotational velocity inputs are created from filters that approximate the immersion rate into the turbulent field. For high-speed flight the vehicle responses were satisfactory for both models. Test pilots could not distinguish differences between the baseline configuration and

SORBET. In low-speed flight the baseline configuration received criticism for its high frequency content, whereas the SORBET model elicited favorable pilot opinion. For this helicopter, which has fully articulated blades, results from SORBET show that vehicle responses to turbulent blade-station disturbances are severely attenuated. This is corroborated by in-flight observation of the rotor tip path plane as compared to vehicle responses.

C-160 GROUND HANDLING MODEL UPDATE USING TAXI TEST DATA

Fischenberg, D., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Moennich, W., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Apr. 1996; 8p; In English; See also 19970000594; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The need for representative ground handling modelling for flight simulators according to modern approval standards is generally strong. A main problem is to find an adequate level of model accuracy for the complex physics of ground related maneuvers. In this paper some examples of the development process of a C-160 ground handling model are presented. The original analytically derived model is updated and validated with taxi test data using system identification methods. Not only the identification of model parameters is discussed, but it is also demonstrated how to derive equivalent submodels in order to reduce the complexity of the data bases without hardly any loss of simulation fidelity.

Mission training or evaluation on a manned military simulator requires the presence of friend and foe forces. These forces, either computer generated or man-controlled, must react in an intelligent manner, in real time. Due to restrictions in software tools and computing power (or manpower in the case of dedicated manned stations), as well as emphasis put on procedural and skill training more than on mission training, many existing simulators feature little or no tactical environment. This paper presents a concept, the tactical environment server, which has been developed to populate the battle space of real time combat simulators with various computer generated friends and foes. In the first part, tactical environment requirements for air combat and land battle simulators are discussed. Coherence between the server and its clients, one of the most problematic technical issues, is analysed. A second part addresses the algorithmic and technological trade-offs one has to consider to implement a real-time tactical environment server. The connection of the server to the client simulator(s), via a network using the DIS protocol or via other solutions, is also discussed. Implementation of a tactical environment servers for a Mirage 2000 and a combat helicopter simulator are presented and conclusions are drawn.

19970000609 Vrije Univ., Dept. of Electronics, Brussels, Belgium
A GENERIC IMAGE PROCESSING TOOL: TOP DOWN BAYESIAN IMAGE ANALYSIS

Dewitte, S., Vrije Univ., Belgium; Mangel, J. M., Royal Military Academy, Belgium; Cornelis, J., Vrije Univ., Belgium; Crommelynck, D., Institut Royal Meteorologique de Belgique, Belgium; Remote Sensing: A Valuable Source of Information; Oct. 1996; 12p; In English; See also 199700006887; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

In this paper we present the top down Bayesian analysis method. This method combines the multi-resolution aspects of the wavelet transform and the general applicability of image analysis in windows.

This generic top down method uses a general purpose image analysis algorithm which starts by analyzing a small amount of global data and refines these analysis results to a large amount of local information. As a refinement method, the theory of Bayes is used. We defined the top down Bayesian image analysis method mathematically in a general way, i.e., without specifying any specific analysis. This stresses the generic nature of the method. To demonstrate this unique method, we worked out its practical application by processing METEOSAT images in three different problems: smoothing interpolation; non-smoothing interpolation; and motion estimation.

CLOSED FORM EXPRESSIONS OF ALGORITHMIC PERFORMANCE AND COMPLEXITY IN SIGNAL PROCESSING**

Marguinaud, Andre, Alcatel Espace, France; Bertrand, Pierre, Alcatel Espace, France; Remote Sensing: A Valuable Source of Information; Oct. 1996; 16p; In English; See also 19970006887; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

In spite of the price deflation of computing power and available simulation tools, closed-form bounds are necessary for system designers to check overall simulation results and to decrease costs. The mathematical concepts used to optimize the algorithms and their associated bounds are: analytic signal representation, the principle of Maximum Likelihood, Neuman Pearson formulation of requirements, Chernoff bounding, quantification optimization at each stage of the processing, weighted least squares, Lagrange multipliers, statistical generating functions, etc. The application of the above methods by means of analytical expressions of performance and graphics covers the following items encountered essentially in transmission: Non-linearity impact on system assessment, MFSK and MPSK modulation, soft decoding of convolutional codes, and combinations of inner and outer codes.

Computer Aided Engineering (CAE) has a long history within Fokker. Already in 1955, the FERTA-computer (Fokkers Eerste Rekenapparaat Type Arra) was used for aeroelastic analysis of the F27. Many disciplines automated their design methods in the sixties and seventies. The resulting islands of automation started to be recognized as a problem only afterwards. Fokker Aircraft come to a point where significant progress could only be achieved by integrating the various disciplines and their CAE-models. These models should be applied in support of a properly design process. Therefore, the CAE-project was started in 1994. During this project a transition was made from 'each specialist building his own CAE-model' towards teamwork in building multidisciplinary CAE-models. This will be illustrated by a number of examples from such areas as weight and balance, flight dynamics and structural design and optimization. Finally, a view on future developments is presented, building on the historical perspective of CAE developments at Fokker Aircraft.

In this survey, carried out within the framework of EUCLID RTP 6.5 CREW ASSISTANT project, the following, Advanced information

Processing (AIP) technology areas were surveyed: Software Engineering, Knowledge-Based Systems, Distributed Artificial Intelligence, Learning Systems, Planning, Model-Based Reasoning, Case-Based Reasoning, and Object-Oriented Databases. The survey evaluated the AIP technology areas with respect to the a predetermined set of criteria. The following criteria were used: Functionality, Reliability, Performance, Modularity, Integration with other technologies, Engineering methodology, Maturity and next generation, and Availability within consortium. The main findings are: AIP technologies have a high degree of applicability in the A in general. The current state of the art in AIP technologies is at a mature level to offer acceptable solutions for the Crew Assistant development. It can be said that basically all of the AIP technologies investigated may be employed in some way in the CA development.

Contains the papers presented at a Lecture Series on 'Soft Computing' technologies. Soft computing addresses the pervasive imprecision of the real world by consideration of the tolerances for imprecision, uncertainty and partial truth to achieve tractable, robust and low-cost solutions for complex problems. Topics covered include soft computing for computation and machine intelligence, neural networks, fuzzy logic, inference and fuzzy control, hybrid architectures for intelligent and learning inference systems, and applications to target tracking and acquisition and the reconfiguration of damaged aircraft. The Lecture Series was sponsored by the Mission Systems Panel of NATO's Advisory Group for Aerospace Research and Development (AGARD).

TECHNIQUES FOR COMPUTATIONAL AND MACHINE INTELLIGENCE SOFT COMPUTING

Krogmann, U., Bodenseewerk Geraetetechnik G.m.b.H., Germany; Advances in Soft-Computing Technologies and Application in Mission Systems; Sep. 1997; 14p; In English; See also 19970030248; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

There is a paradigmatic complementary shift from symbolic AI/KB techniques to so called Soft Computing technologies. The new paradigm is based on modeling the unconscious, cognitive and reflexive function of the biological brain. In contrast to the conventional Hard Computing, Soft Computing addresses the pervasive imprecision

sion of the real world. This is accomplished by consideration of the tolerances for imprecision, uncertainty and partial truth to achieve tractable, robust and low cost solutions for complex problems. The objective of this paper is to introduce Soft Computing and to briefly familiarize the reader with important Soft Computing techniques. This is accomplished by first of all defining what is meant by computational and artificial intelligence and why as well as for which functions computational intelligence is needed. Based on brainlike structures the most important techniques of Soft Computing such as fuzzy logic, artificial neural networks and genetic algorithms are briefly described. The approaches treated provide the basis for adaptive, learning control, advanced automation and artificially intelligent machines.

MISSION SOFTWARE - THE NEXT 25 YEARS

Mayoh, Howard, Smiths Industries Aerospace and Defence Systems Ltd., UK; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 2; 6p; In English; See also 19980016571; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

The growth in computing technology over the last 25 years has been truly dramatic. The techniques used to develop the software have also seen significant changes. The growth in avionics software has been no less dramatic. This paper considers the changes that have occurred, and that will continue to take place in the future, in terms of three generations of avionic computing. The First Generation covers the early application of computing to mission system applications. These mission applications were distributed over few computing centres, with very little communication between them. The Second Generation of avionics computing is characterized by a major growth in the size and complexity of the software applications. The changes we can expect over the next generation, the Third Generation, of avionic computing will be as great as those between the first and the second. The most significant change will probably be in the avionic computing architecture, in that Integrated Modular Avionics (IMA) will be at the core of the avionic computing infrastructure. The need to reduce pilot workload and increase systems performance will demand an increase in the scale and complexity of mission management applications. To achieve the growth that will be required to support these new applications a significant increase in productivity will be required. The need to develop highly integrated applications across organizational boundaries will mean an increasing emphasis on integrated teams. A combination of IMA architecture, with the growth in size and complexity of the mission systems applications, will introduce a number of software management challenges.

VIRTUAL PRODUCT DEFINITION: THE KEY TO AFFORDABLE AND SUPPORTABLE PRODUCTS

Coyle, John M., McDonnell-Douglas Corp., USA; Paul, Don, Wright Lab., USA; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 1; 14p; In English; See also 19980033517; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Virtual product definition (VPD) is an emerging process which capitalizes on recent advances in computer hardware and software to enable a Paradyme shift in the way products are developed. Engineering, tooling, manufacturing and product support data that fully define the product is created and managed in a synthetic environment. All product definition geometry developed in the VPD process is defined as three dimensional solid digital models. This data is stored in an electronic medium with a common geometry database providing the primary linkage between the product design and a newly developed set of integrated design, analysis, manufacturing and supportability tools. The geometry related information that describes the product may be viewed and interacted with in a synthetic environment

in the same way physical mockups were used in previous design processes. This geometric representation forms the most visible part of a Virtual Prototype.

Virtual Manufacturing (VM) is an integrated, synthetic manufacturing environment exercised to enhance all levels of decision and control. This process uses product, process and resource models to evaluate the producibility and affordability of new product concepts prior to commitment to the final product design. Design processes are captured in a single geometric database and integrated with the planned manufacturing processes resulting in a simulation of the manufacturing environment. The critical questions of manufacturing cycle time, people resource requirements and physical resource requirements for various scenarios are quantified by simulation. Thus, Virtual Manufacturing is a tool to achieve more affordable aircraft designs, reduced cycle times and improved quality.

In 1989, Shorts first looked at the potential of replacing physical wooden mock-ups with electronic solid model assemblies. They took existing drawings of the F100 wing and translated these into a solid mock-up. Although these early solid modellers were not user friendly, the resulting demonstrator was impressive and proved that large assemblies could be produced. This gave Shorts the confidence to embark on a small production contract - Trent Nacelle. This had 10 designers working concurrently generating structures, hydraulic and electrical systems all as solid models. Initially there was concern because the project planners who traditionally measure drawing output were getting very little drawings released during the first half of the program as the solid models and assemblies were being created. However, the drawing output increased dramatically near the end because of the fast production of assembly drawings giving a resulting overall reduction in leadtime of 20%. This result set the scene for the technology strategy on the Lear 45 when the decision was made to solid model the complete aircraft including all structures, hydraulic and electrical systems.

A VIRTUAL RAFALE: COMPLETELY DIGITAL APPROACH FOR PRODUCT AND PROCESS

Rouchon, C., Dassault Aviation, France; May 1998; 6p; In English; See also 19980202235; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

To survive in strong present competition, Dassault Aviation has to ensure a constant update of its organization, management methods and information system. This permanent research has to produce a right compromise between cost, cycle and performances, both for civil and military aircraft. The Digital Mock-Up (DMU) provides support for Concurrent Engineering (CE) methodologies and contributes directly to customer satisfaction. In the first part, we will introduce the Dassault's use of CE methodologies as a systematic approach to inte-

grated development of a product with the manufacturing processes and customer support. We will emphasize the importance of Teamwork-based decisions, co-specifications, cross-discipline cooperation, efficient communication, change management, simulations, etc. The second part will be dedicated to CAD/CAM techniques and their extension: Virtual Reality (VR). We will not mention all the activities related to flight simulators.

While a CAD model provides the starting point in conventional "engineering", the process is turned upside down in "reverse engineering", for an existing physical part is the starting point. We have developed an innovative reverse engineering tool providing an efficient link between the real world and the virtual world. Surface-like measuring technology provides "express access" to the world of computer data. Innovative triangulation procedures enable complicated CAD modelling to be circumvented, thus providing a direct transition to production.

AEROSPACE APPROACH FOR VIRTUAL MANUFACTURING APPROCHE AEROSPATIALE POUR LA FABRICATION VIRTUELLE

Dureigne, M., Aerospatiale, France; May 1998; 6p; In French; See also 19980202235; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

The paper analyzes, in the first step, virtual manufacturing deployment within Aerospatiale with the development of information technology tools. It points out the importance of man and the diversity of solutions. This deployment is clearly linked to the main characteristics of Aerospatiale: high technology, human potential stable, skilled and open to innovation, all products developed in a multi-language and cultural partnership. In the second step, the deployment is analyzed through a system methodology to derive the main drivers of the deployment. In the last step, the paper presents the research work preparing the next state of deployment. This state will put emphasis on refined product models, distributed virtual manufacturing and semantic based language to improve both people and machine data processing. But as usual, the next state will heavily rely on the ability of research work to lead to easy appropriation of new technologies by people and organizations.

In the 27 years since it was founded, Airbus Industrie has developed a portfolio of aircraft in the above 100 seat range which has captured over 35% of the global market. This has been achieved despite the fact that, up to 1995, the Airbus partners used a variety of software systems. However, at the end of 1995, the four Airbus partners signed an historic contract, committing the partnership to buying at least 1500 seats of common CAD/CAM/CAE and enterprise data management software from a common supplier - Computervision. Airbus realized that its aggressive competitive goals could only be reached if all partners adopt common ways of working across Europe. To drive this change, it launched an Airbus Concurrent Engineering (ACE) project in 1996 to enable it to revolutionize the way it designs, builds and supports aircraft. This paper will describe the work in British Aerospace to produce a radical vision of world class people, processes, systems, teamworking and performance. It will illustrate how this vision was developed and shared by the Airbus partnership, resulting in a strategic plan to provide a revolutionary change in performance, enabling Airbus Industrie to proceed towards its goal of being a leading aircraft manufacturer in the world. It will show that ACE is "not just another IT programme" but a change programme delivering hardware, software, networks, processes, tools, methodologies, organization, training and support in a contract with Airbus aircraft programmes called a "version". The pivotal role that the ACE project plays was reinforced by the Airbus partners signing a memorandum of understanding with the intention to establish a single Airbus company by 1999.

Virtual Manufacturing is an integrated set of tools and technologies which provide a highly accurate near real time 3D simulation environment to evaluate: new or exiting methods and processes; tool and fixture design/assembly sequences; facility layouts and material flow; ergonomic/human factors; and alternate production scenarios involving one or more products. Boeing is expanding its usage of these tools and technologies, as utilization in selected applications has demonstrated dramatic improvements in reducing cycle time and cost, while improving productivity and product quality. This paper will discuss our application of and experience with Virtual Manufacturing for an ever expanding breadth of applications. These include: simulating kinematic devices for Space Station; robotic painting; visualization of airplane assembly processes; and simulation of man/machine interactions, numerically controlled (N.C.) machining cells and composite fabrication processes. With the successes experienced to date, the authors will look into the next millennium, projecting further advancements in technology and its' projected usage in the aerospace industry.

The geometry based aircraft design to manufacturing process is described, highlighting the extensive use of simulation activities along its phases to verify the geometry. It is shown that the manufacturing simulation has an exceptional role in minimizing or even avoiding global iteration loops. In addition, some wording is defined in the world of virtual manufacturing to be able to position the different software developments. Based on this information two examples are shown - the composite stiffener technology and the composite skin technology - both based on prepreg tape targeting for high performance aircraft structures. Due to the full usage of all necessary material-, manufacturing-, and machine data right from the beginning of the design it is demonstrated that a fully automatic NC-code generation can be achieved at the end of the engineer's design process producing verified manufacturable data without any additional human interaction based on the designed geometry. By means of this, time consuming iteration loops coming back from the manufacturing phases and creating local iteration loops to the structural analysis are avoided. Real examples of this "virtual manufacturing" process are indicating 10 to 50 times faster processes compared to existing methods. Finally, for both manufacturing technologies the integration with the corresponding optimization code is explained, outlining the important issues in this field.

This paper describes an object-oriented data/knowledge model for interactive part and process design. This model is employed in a Computer Aided Process Planning (CAPP) kernel. Objects are used to represent the process planning information. Each data-object has attributes, a set of methods, a constructor, etc. The information contained in such objects can be supplied either by a software expert module or by the human expert, through an interface that is provided for each type of object. Consulted expert modules will take into account the information that was added by the human expert (or by earlier consulted expert modules). Moreover, the interface to human expert allows him/her to verify, accept or alter the information generated by an expert module, at any time. Objects with partial information (empty attributes, attributes that describe intervals or constraints or multiple discrete values, etc.) will be called virtual objects, while objects that are unambiguously determined by the information contained in their attributes will be called physical objects. The paper elaborates on the distinct knowledge sources and their relation with the data model. It explains, for each knowledge source, its representation and its instantiation. Further, the aspect virtual versus physical object is handled; i.e. how virtual objects evolve towards physical objects by providing them with necessary information.

In 1995, the Joint Strike Fighter (JSF) program office, through the USAF Wright Laboratory's Manufacturing Directorate, contracted with Hughes Aircraft Company to define and demonstrate a development methodology that incorporates lean practices and tools and integrates design and cost information. This methodology will be refined, demonstrated and shared with the JSF contractor community. The JMD program is a 40-month effort in two phases. The first phase developed the initial JMD lean methodology and demonstrated its application to a Transmit/Receive microwave electronic modules used in active array radars. The second phase will refine the methodology and demonstrate it on a more complex subarray assembly. This paper describes the JMD program and presents its progress to date.

MULTI-PHYSICS MODELLING: A VITAL COMPONENT OF VIRTUAL MANUFACTURING

Cross, M., Greenwich Univ., UK; Bailey, C., Greenwich Univ., UK; Pericleous, K., Greenwich Univ., UK; McManus, K., Greenwich Univ., UK; Bounds, S., Greenwich Univ., UK; Moran, G., Greenwich Univ., UK; Taylor, G., Greenwich Univ., UK; Wheeler, D., Greenwich Univ., UK; May 1998; 12p; In English; See also 19980202235; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

One of the core tasks of the virtual-manufacturing environment is to characterize the transformation of the state of material during each of the unit processes. This transformation in shape, material properties, etc. can only be reliably achieved through the use of models in a simulation context. Unfortunately, many manufacturing processes involve the material being treated in both the liquid and solid state, the transformation of which may be achieved by heat transfer and/or electromagnetic fields. The computational modeling of such processes, involving the interactions amongst various interacting phenomena, is a considerable challenge. However, it must be addressed effectively if Virtual Manufacturing Environments are to become a reality. This contribution focuses upon one attempt to develop such a multi-physics computational toolkit. The approach uses a single discretization procedure and provides for direct interaction amongst the component phenomena. The need to exploit parallel high performance hardware is addressed so that simulation elapsed times can be brought within the realism of practicality. Examples of multiphysics modelling in relation to shape casting, and solder joint formation reinforce the motivation for this work.

A RADICAL NEW WAY OF PRODUCT DEVELOPMENT: EXPLORING THE BENEFITS WITH VIRTUAL REALITY IN VIRTUAL CONCEPT

Nordlander, Sverker, Prosolvias Clarus A.B., Sweden; May 1998; 8p; In English; See also 19980202235; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

With the introduction of powerful Virtual Reality (VR) tools, changes to the product development process have started. However, the potential of these tools are today not fully explored since the changes to the process still is very limited. The technique behind VR and the possibilities that it offers is very promising. Due to increasing performance of computers, at a reasonable low price, it is now possible to implement and use VR for several new tasks that earlier were restricted due to the complexity of the system and cost of the solution. Using it in new areas also put additional requirements on the solutions such as the need for simpler user interfaces. In this paper, a new way of using VR technology in product development is described together with some of the benefits it gives. Some of the requirements on the

62 COMPUTER SYSTEMS

environment is also discussed and a new phrase "Virtual Concept" is introduced as well as a short description on the thoughts behind the model.

We overview two sequential and parallel partitioned procedures that are popular in computational nonlinear aeroelasticity, and address their limitation in terms of accuracy and numerical stability. We propose two alternative serial and parallel staggered algorithms for the solution of coupled transient aeroelastic problems, and demonstrate their superior accuracy and computational efficiency with the flutter analysis of the AGARD Wing 445.6. We contrast our results with those computed by other investigators and validate them with experimental data.

LAYERED FAULT TOLERANT ARCHITECTURE TO SUPPORT CONTEXT-SENSITIVE REASONING FOR LETHAL UNMANNED AERIAL VEHICLE APPLICATION

Rau, Jennifer, Johns Hopkins Univ., USA; Jul. 1998; 8p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper provides a description of communication utilities implemented to support fault tolerant features for a layered processor architecture. The defined software modules used existing message passing software based on TCP/IP, UDP protocols. The prototype software was tested to verify the routing, network diagnosis, and network recovery functions. Message traffic was monitored and after inducing a failure, the application was restarted without loss of state. The capability provided by these software modules can be readily applied with the definition of application specific messages and state variables. The layered processor architecture and associated communication utilities were developed to provide a basis for improved autonomous vehicle performance. It supports this goal by providing graceful degradation due to processor failures, optimization of onboard processing capability, subsystem communications, data collection and validation of subsystem data to support context-sensitive reasoning, elimination of single point failures in the processor and communications architecture, and isolation of high-level processing functions from payload integration specifics. A candidate software architecture for lethal UAV reasoning functions has been provided to establish the benefits of an integrated design approach. This software architecture supports all key reasoning functions including: sensor management, weapon management, vehicle control, fault handling, target identification, target localization, maneuver control and mission replanning. The indicated data flows in the figures provided, identify interaction between these functions and subsystems. The defined software architecture for lethal UAV application builds on the layered processor architecture's key features to enhance the vehicle's mission effectiveness and survivability.

This chapter is intended to highlight prospects and challenges of some topics of Fluid Dynamics considered to be critical to technology advances which are discussed in Volumes I and II or in other chapters of Volume III. Therefore it is not an exhaustive discussion of all of the required research in Fluid Dynamics necessary for technical leadership in the 21st Century. In this regard, the reader may not agree with the inclusion of some topics and the omission of others. The content reflects the consensus reached within the AGARD Fluid Dynamics Panel on "critical" topics. Continued research in Fluid Dynamics will be necessary in order to realize the affordability goals that NATO is discussing for future systems. Whether the medium be water, air or real gases, fluid dynamics is the technical area that determines the external shape and controllability of the vehicle to satisfy the design mission requirements. Designing the vehicle correctly the first time has an enormous influence on the total design cycle. In addition, the accurate determination of vehicle performance, controllability, and loads through continued improvement in Computational, Experimental and Fundamental Fluid Dynamics, will allow design margins in other technical disciplines (i.e. Structures, etc.) to be reduced thereby providing the most economical integrated design.

Rapidly changing computing capabilities and simulation software have created the potential for an affordable product and process development protocol for new products. The concept of an Integrated Collocated product design team has already given way to an electronically collocated design team that functions in a synthetic environment without regard to company structure or national boundaries. The simulation and modelling toolset and supporting computational capabilities are exiting the twentieth century at a breath taking pace. The war fighting simulation models and distributed simulation tools have created the capability to experience near real engagements for tanks, ships and aircraft in a synthetic environment. Physics based simulation or products and processes are continuing to improve the modelling capability for synthetic test.

PARALLEL ITERATIVE SOLUTION METHODS FOR LINEAR SYSTEMS ARISING FROM DISCRETIZED PDE'S

Vandervorst, Henk A., Utrecht State Univ., Netherlands; AGARD, Special Course on Parallel Computing in CFD; Oct 1, 1995, 39 p; In English; See also 19960009081; Avail: CASI; A03, Hardcopy; A03, Microfiche

In these notes we present an overview of a number of related iterative methods for the solution of linear systems of equations. These methods are so-called Krylov projection type methods and they include popular methods such as Conjugate Gradients, Bi-Conjugate Gradients, CGS, Bi-CGSTAB, QMR, LSQR and GMRES. We show how these methods can be derived from simple basic iteration formulas. Iterative methods are often used in combination with so-called preconditioning operators (approximations for the inverses of the operator of the system to be solved). Since these preconditioners are not essential in the derivation of the iterative methods, we will not give much attention to them in these notes. However, in most of the actual iteration schemes, we have included them in order to facilitate the use of these schemes in actual computations. For the application

of the iterative schemes one usually thinks of linear sparse systems, e.g., like those arising in the finite element or finite difference approximations of (systems of) partial differential equations. However, the structure of the operators plays no explicit role in any of these schemes, and these schemes might also successfully be used to solve certain large dense linear systems. Depending on the situation that might be attractive in terms of numbers of floating point operations. It will turn out that all of the iterations are parallelizable in a straight forward manner. However, especially for computers with a memory hierarchy (i.e., like cache or vector registers), and for distributed memory computers, the performance can often be improved significantly through rescheduling of the operations. We discuss parallel implementations, and occasionally we report on experimental findings.

This lecture is devoted to the parallelization of block structured grid solvers for industrial applications. It is divided into two parts. Part 1 describes well established numerical algorithms with emphasis on spatial discretization and time stepping schemes. Attention is focused on the multigrid technique which is one of the most promising approaches to improve the efficiency of numerical methods. Finally, several large-scale computations are shown which demonstrate the ability of current block structured flow solvers. Part 2 of the lecture addresses various aspects of the parallelization of such flow solvers.

This paper reviews some general considerations on the parallelization of large block structured flow solvers for production use. Parallelization is therefore not treated as an isolated subject of research, but as a tool to increase the computational power for the user and as an integral part of the developmental environment of a CFD (computational fluid dynamics) code. As an example, the parallelization of the FLOWer code using the portable communications library CLIC-3D is given. Results of benchmark tests obtained on various computer hardware architectures demonstrate today's possibilities of parallel processing in CFD applications.

Consideration is given to the techniques required to support adaptive analysis of automatically generated unstructured meshes on distributed memory MIMD parallel computers. The key areas of new development are focused on the support of effective parallel computations when the structure of the numerical discretization, the mesh, is evolving, and in fact constructed, during the computation. All the procedures presented operate in parallel on already distributed mesh information. Starting from a mesh definition in terms of a topological hierarchy, techniques to support the distribution, redistribution and communication among the mesh entities over the processors is given, and algorithms to dynamically balance processor workload based on the migration of mesh entities are given. A procedure to automatically generate meshes in parallel, starting from CAD geometric models, is given. Parallel procedures to enrich the mesh through local mesh modifications are also given. Finally, the combination of these techniques to produce a parallel automated finite element analysis procedure for rotorcraft aerodynamics calculations is discussed and demonstrated.

The intent of these notes is to review several basic algorithms and procedures used in computational fluid dynamics (CFD) with emphasis on algorithms suitable to parallel computing environments. In particular, we concentrate on numerical methods in CFD which require the formation and solution of large sparse linear systems of algebraic equations. These matrices arise from the discretization of the Navier-Stokes equations which govern compressible fluid flow. From this point of view, a large portion of these notes addresses algorithms used in the formation, manipulation, and solution of sparse matrices on serial and parallel computers.

The accurate prediction of aeroelastic phenomena such as divergence and flutter is essential in the design of high performance and safe aircraft. This prediction requires solving simultaneously the coupled fluid and structural equations of motion. Therefore numerical aeroelastic simulations are, in general, resource intensive. They belong to the family of Grand Challenge engineering problems and as such, can benefit from parallel processing technology. This paper highlights some important aspects of nonlinear computational aeroelasticity. These include a three-field arbitrary Lagrangian-Eulerian (ALE) finite element/volume formulation for coupled transient aeroelastic problems; a rigorous derivation of geometric conservation laws (GCLs) for flow problems with moving boundaries and unstructured deformable meshes; the design of a family of staggered procedures

for the efficient solution of the coupled fluid/structure partial differential equations; and fast parallel domain decomposition solvers. The derivations of the GCLs are presented for ALE based finite volume formulations as well as ALE based stabilized finite element methods. The impact of these GCLs on the numerical algorithms used for time-integrating the semi-discrete equations governing the structural and fluid mesh motions is also discussed. The solution of the governing three-field equations with mixed implicit/implicit and explicit/implicit staggered procedures are analyzed with particular reference to accuracy, stability, subcycling, distributed computing, I/O transfers, and parallel processing. A general and flexible framework for implementing the partitioned analysis of coupled transient aeroelastic problems with non-matching fluid/structure interfaces on heterogeneous and/or parallel computational platforms is also described. This framework and the staggered solution procedures are demonstrated with examples ranging from the numerical investigation on an iPSC-860 massively parallel processor of the instability of flat panels with infinite aspect ratio in supersonic airstreams, to the solution on the Paragon XP/S, Cray T3D and IBM SP2 parallel systems of three-dimensional wing response problems in the transonic regime.

The hardware prototype of a MIMD (multiple instruction multiple data) computing machine dedicated to the processing of large amounts of data in real time is described. The Lattice Automata Machine (LAM) is based on cellular automata architecture, but has extended features, for example, 'non-local' and 'time dependent' programming. The front end of LAM is hosted in a personal computer, used as an input/output peripheral. This machine has been developed for the dedicated programming of systems using partial differential equations and processes of up to 1.15 Giga events per second. One of the hardware characteristics introduced in this machine is the possibility of memory replication in different data banks, enabling the simultaneous access to different RAM positions.

MULTI-SENSOR DATA FUSION IN COMMAND AND CONTROL
AND THE MERIT OF ARTIFICIAL INTELLIGENCE**

Zuidgeest, Rene G., National Aerospace Lab., Netherlands; AGARD, Guidance and Control for Future Air-Defence Systems; Jan 1, 1995, 12 p; In English; See also 19950025702; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

The human operator observing the real world is confronted with a huge amount of data from multiple sensor systems observing that world. Multi-sensor data fusion (MSDF) is one of the emerging fields in advanced information processing, concerned with fusing sensor data from these multiple sensor systems. Automated multi-sensor data fusion can help the operator by processing sensor data into concise and surveyable information that is more useful than each sensor system separately can provide. The merit of MSDF can be increased by employing the knowledge of the human operator about the real world, the sensor systems and the fusion process. With the aid of this knowledge, automated MSDF can assign meaning to sensor

data and is able to reason about the observed world at a high level, comparable to what humans do. Artificial intelligence provides techniques to represent this knowledge and to reason with it. These techniques are discussed in the context of a generic framework comprising a world model and fusion processes. These techniques can contribute to an effective updating of the world model and can support its fusion processes. In addition, a global distributed fusion architecture based on the framework is proposed. As specific domain of fusion, battlefield surveillance is considered. This paper shows the potential use of artificial intelligence in multi-sensor data fusion.

The research and development (R&D) group at UNISYS Government Systems Group (GSG) Canada is working on a demonstration model of a multi-sensor data fusion (MSDF) implementation for the Canadian Patrol Frigate (CPF). The conditions are made very realistic by the use of the Software Test and Development Facility (STDF) situated on the premises in Montreal. The paper describes the implementation design of the system. More emphasis is put on the architecture of both the simulation and the fusion systems. The fusion system is divided into four processes: Information Management (IM), Multi-Sensor Data Fusion (MSDF), Performance Evaluation (PE) and Display Management (DM). Each process within the fusion system is outlined.

Artificial neural networks based on models which were developed in the context of brain research are becoming a significant data processing tool. Neural computing algorithms are robust, parallel, can be trained from examples, and perform associative memory recall. Special purpose hardware is essential for implementing these algorithms effectively. Combined optoelectronic implementations of these models seem to be the preferred embodiments. Two approaches for implementing artificial neural networks by a combined optoelectronic systems will be described: the optical disk based artificial neural networks and the electroholographic artificial neural networks.

In aerospace systems classical control technology has enabled the transfer of functions of the human operator to machines which need not be based on the explicit evaluation of knowledge. Symbolic data processing, neural networks and the techniques of artificial intelligence now permit the design of automatic systems which can explicitly make use of knowledge stored in computers. The Lecture Series presents a conceptual framework for the automation of knowledge-based control and management functions in aerospace systems, which are usually carried out by human operators. It describes the structure of these functions, discusses successful examples of application and gives recommendations for further studies.

FUNCTIONAL ANALYSIS/DECOMPOSITION OF CLOSED-LOOP, REAL-TIME WORK PROCESSES

Adams, Milton B., Draper (Charles Stark) Lab., Inc., USA; AGARD, Knowledge-Based Functions in Aerospace Systems; Nov 1, 1995, 10 p; In English; See also 19960012290; Avail: CASI; A02, Hardcopy; A02, Microfiche

Performing a functional analysis is the first step in developing a solution to a complex problem. The functional analysis of a generic complex, real-time, closed-loop process presented here serves to establish a common framework and a common language for describing a variety of specific guidance and control related processes. The two principal components of a functional analysis are (1) a functional decomposition and (2) a detailed description of the information flow contained in the interfaces between the individual functions comprising that decomposition. The approach taken here is the classical structured analysis with a dataflow representation. A dataflow representation has been chosen because it readily lends itself to a hierarchical description. That is, each individual function can

be further decomposed into more refined subfunctions which, when taken together, have combined inputs and outputs which are consistent with those of the original function. Neither control flow representations nor object oriented analysis is addressed.

The present paper deals with the application of artificial neural networks for flight guidance and control. After an introduction to the problem, the structure and functioning of feed-forward neural networks, the transient response and the learning mechanism for these networks is examined. This is followed by the development of the structure of the flight guidance and control loop with neural networks. The neuronal flight controller is not programmed but first learns the knowledge needed for stable flight guidance and control in a separate training and learning phase and then continues learning in the actual utilization phase. For a typical missile as a concrete example, the neural controller is trained and tested in a simulated utilization phase. On the whole, a good to very good control behavior is achieved with the time-variant, non-linear control plant. This paper shows a new way of implementing reliable, non-linear learning autopilots which can be realized in hardware as parallel signal processing modules.

USE OF NEURAL NETWORKS/GENETIC ALGORITHMS FOR FAULT DETECTION AND SENSOR LOCATION

Tomlinson, G. R., Sheffield Univ., UK; Worden, K., Sheffield Univ., UK; Staszewski, W., Sheffield Univ., UK; Smart Structures and Materials: Implications for Military Aircraft of New Generation; Oct. 1996; 6p; In English; See also 19970001697; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

An approach to fault detection and sensor location using neural networks and genetic algorithms is described. A plate representing an aircraft panel is used as the structure and static strains, derived from a Finite Element model of the plate, are used as the supervised training set for the neural network. Having established a suitable diagnostic network, the process of optimal sensor location is carried out using a genetic algorithm for the diagnostic system. The final part of the paper briefly describes a new approach to fault detection using Novelty Measures which removes the need to use a supervised learning approach, common to most classical neural network procedures.

GREY LEVEL SEGMENTATION WITH SELECTABLE NUMBER OF DISCRIMINATION LEVELS USING HOPFIELD-LIKE NEURAL NETWORKS WITH CONSTRAINT SATISFACTION CRITERIA

Domingo, Alberto, Sener Ingenieria y Sistemas S.A., Spain; Santamaria, Javier, Sener Ingenieria y Sistemas S.A., Spain; Multi-Sensor Multi-Target Data Fusion, Tracking and Identification Techniques for Guidance and Control Applications; Oct. 1996, 167-174; In English; See also 19970012579; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

A method is proposed for grey-level image segmentation which combines the benefits of an Artificial Neural Network (ANN) approach with the definition of simple, intuitive constraints that govern the network behaviour. Several schemes are introduced for the definition of the constraints, as well as for the network potential initialization criteria. A new neural network model, derived from the Hopfield Neural

Net, is proposed, adapted to the defined constraints. Obtained results are shown and compared with those achieved with classical algorithms.

MULTI-SENSOR DATA FUSION IN COMMAND AND CONTROL AND THE MERIT OF ARTIFICIAL INTELLIGENCE

Zuidgeest, Rene G., National Aerospace Lab., Netherlands; Multi-Sensor Multi-Target Data Fusion, Tracking and Identification Techniques for Guidance and Control Applications; Oct. 1996, 284-294; In English; See also 19970012579; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The human operator observing the real world is confronted with a huge amount of data from multiple sensor systems observing that world. Multi-Sensor Data Fusion (MSDF) is one of the emerging fields in advanced information processing, concerned with fusing sensor data from these multiple sensor systems. Automated multi-sensor data fusion can help the operator by processing sensor data into concise and surveyable information, that is more useful than every sensor system separately can provide. The merit of MSDF can be increased by employing the knowledge of the human operator about the real world, the sensor systems and the fusion process. With the aid of this knowledge, automated MSDF can assign meaning to sensor data and is able to reason about the observed world at a high level, comparable to what humans do. Artificial intelligence provides techniques to represent this knowledge and to reason with it. These techniques are discussed in the context of a generic framework comprising a world model and fusion processes. These techniques can contribute to an effective updating of the world model and can support nS fusion processes. In addition, a global distributed fusion architecture based on the framework is proposed. As specific domain of fusion, battlefield surveillance is considered. This paper shows the potential use of artificial intelligence in multi-sensor data fusion.

INTRODUCTION TO NEURAL NETWORKS BASIC THEORY AND APPLICATION POTENTIAL FOR MISSION SYSTEMS

Collins, Daniel J., Naval Postgraduate School, USA; Sep. 1997; 12p; In English; See also 19970030248; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

This lecture is a brief introduction to neural networks. Modern approaches to complex engineering problems typically involve the development of a computer algorithm with a specified set of inputs. For a well posed problem the inputs specify a unique output or solution. Thus for the state variable linear quadratic problem in control theory with the plant specified one uses a Riccati equation to obtain a set of unique feedback gains.

Fuzzy systems are very efficient since they are generally based on expert knowledge, they are very robust and flexible and they manage interpretable knowledge. The main problem in their construction is the tuning of all the parameters involved in their construction: shapes and parameters of membership functions, numbers of classes in fuzzy partitions of the universes of definition of variables (number of available characterizations for each variable), number of rules, values of the rule conclusions when they are crisp. While it is interesting to allow the designer of the fuzzy system to make some of the choices, the automatic tuning of the other parameters is a valuable help. In the case where training sets of data are available, it is possible to use automatic methods for the learning part of a fuzzy system. Neural networks are powerful for learning. We present the main complementary utiliza-

tion of these techniques. WE have treated separately genetic algorithms. Finally, we show that special types of fuzzy systems themselves can be considered as learning systems.

DUAL WAVEBAND INFRA-RED TARGET TRACKING AND ACQUISITION SYSTEM

Bernhardt, M., Defence Research Agency, UK; Welch, M., Defence Research Agency, UK; Toulson, D. L., London Univ., UK; Sep. 1997; 14p; In English; See also 19970030248; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

The introduction of Infra-Red (IR) systems onto military fast-jet platforms, particularly Forward Looking Infra-Red (FLIR) has extended the operational envelope of these aircraft by giving them a night flying capability. FLIR systems commonly use the 8-12 micron wavelength band of the IR spectrum as this is part of the IR spectrum where there is good atmospheric transmission. Conveniently, objects at room temperature have peak IR emissions within this band too. Some FLIR systems use the 3-5 micro band, which also has good atmospheric transmission and where hotter objects, such as aircraft exhaust plumes, have their peak emission. In this paper we describe an ATR system using FLIR imagery which has the following features: 1. it uses two wavebands of digital FLIR imagery simultaneously to extract additional scene information by data fusion; 2. it is designed to work for targets that occupy only a few pixels in the image; 3. it uses a neural network for initial clutter rejection; 4. it uses a novel probabilistic tracking methodology; 5. it uses a committee of neural networks for final confirmation of targets, and 6. it is being evaluated on real flight trials data. The structure of this paper is as follows: a brief outline of a simple ATR process and describes its limitations; a discussion about the improved architecture, its extension to two wavebands of FLIR imagery and the novel aspects of the neural networks and their training; a discussion the preliminary results and ongoing evaluation; a number of novel enhancements to the neural networks that have been investigated, and conclusion and summarizes the paper.

Although the title of this lecture refers to using Artificial Neural Networks (ANN) in reconfiguration algorithms of damaged aircraft, the analysis applies in general to the identification and control of non-linear time-varying dynamical systems. This lecture addresses the problem of emulation and control of a fighter aircraft by means of ANN. Four models for describing non-linear MIMO dynamical systems are described. Based on this description a combined feedforward and recurrent neural network is structured to emulate the system. A procedure is given to emulate multiple systems in a single neural network. By the introduction of a minimal realization of the network, the complexity of the network is greatly reduced without degradation of the operating performance of the network. The aircraft model used in the demonstration of the neural network is the longitudinal mode of the F/A-18A fighter aircraft. The work developed here is based on Shaker Dror.

The development, procurement and utilization of defense systems will in future be strongly influenced by affordability. A consid-

erable potential for cost reduction is seen in the extended use of unmanned systems. This paper will describe important enabling techniques and technologies as a prerequisite for the implementation of future autonomous systems with goal- and behavior-oriented features. Main emphasis is being placed on information technology with its soft-computing techniques. The treatment of conceptional system approaches will be followed by design considerations and then a global methodology for the engineering of future autonomous systems will be dealt with. Critical experiments for technology evaluation and validation will be mentioned together with a brief description of the main focus in future research.

Situation awareness is the ability of an unmanned vehicle intelligent control system to model the world. A world model is an intelligent system's current internal estimate of the state of the world, plus its prior knowledge of the history of the world, plus knowledge about the rules of physics and mathematics, plus rules of behavior, task skills, and basic values. World modeling is the ability of the intelligent system to maintain and use a world model to predict and filter sensory experience, to understand the past, and to simulate the future. Perception is the functional transformation of data from sensors into situational awareness.

The use of computational-model trained artificial neural networks to acquire damage specific information from electronic holograms is discussed. A neural network is trained to transform two time-average holograms into a pattern related to the bending-induced-strain distribution of the vibrating component. The bending distribution is very sensitive to component damage unlike the characteristic fringe pattern or the displacement amplitude distribution. The neural network processor is fast for real-time visualization of damage. The two-hologram limit makes the processor more robust to speckle pattern decorrelation. Undamaged and cracked cantilever plates serve as effective objects for testing the combination of electronic holography and neural-net processing. The requirements are discussed for using finite-element-model trained neural networks for field inspections of engine components. The paper specifically discusses neural-network fringe pattern analysis in the presence of the laser speckle effect and the performances of two limiting cases of the neural-net architecture.

It can be stated that significant changes are currently taking place in the new IT and MT regarding functional capabilities, performance, characteristics and cost. These changes will influence the user and the supporting industries' organizational structure. The rate of change and related realizations will exceed normal evolution and will have great social impacts accompanying the technological and functional advances. In order to accommodate this, the strategies of users and industry must be adapted accordingly.

Several improvements were carried out on the anti-G suits and on the anti-G valves. These improvements should enhance G tolerance and pilot effectiveness under G. Most of these improvements need to be applied in operational use and not be simply reserved for the research world. In order to achieve this, these new anti G equipments must be the least cumbersome and intensive for pilots and efforts must be made to ensure their acceptability.

GLOBAL/LOCAL ANALYSIS IN FINITE ELEMENT TECHNOLOGY
Marchese, P., Alenia Spazio S.p.A., Italy; Gualtieri, N., Alenia Spazio S.p.A., Italy; Augello, G., Alenia Spazio S.p.A., Italy; Oct. 1996; 16p; In English; See also 19970010666; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

In the design and verification of complex structures the global analysis gives the internal load paths, whereas the local analysis computes stresses and strains. These analyses are performed using classical methods, the Finite Element Analysis (FEA), or a combination of both. The outstanding development in the finite element methodology and the explosion in computer hardware capability led to direct applications of the FEA techniques to global and local analyses, with reduction of computation time and improvement in the results accuracy. This paper explores some of the FEA practices currently in use, focusing on work presently being performed in Alenia Spazio.

Recent experience has demonstrated NATO's difficulty in planning and coordinating International Aeromedical Evacuation of acutely sick, injured and wounded patients. There is much discussion which seeks to clarify and define NATO's role in medical air evacuation. Papers in this Symposium updated available data in medicine research and development and provided a focal point for discussion of specialized equipment and techniques required to care for patients in the NATO Medevac System. The Symposium covered also the role, training, procedures as well as command and control in the management of casualties in the aeromedical evacuation system. There is a clear operational need to provide medical planners within NATO and Alliance Nations with a generic concept of integrated aeromedical evacuation to improve the effectiveness of NATO forces.

USE OF QUALITY TOOLS TO RE-ENGINEER THE AEROMEDICAL EVACUATION (AE) SYSTEM

Bloomquist, Carroll R., Department of the Air Force, USA; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 4 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A02, Microfiche

The element of change pervades each of our activities; defining change should be accomplished in a logical fashion using definitive tools. A number of quality tools are available to produce rational, well-defined change in a large complex system. One of these methods, the Theory of Constraints (TOC) will be the focus of this paper with regard to designing and implementing change for the USA (U.S.) Department of Defense (DOD) aeromedical evacuation (AE) system. Improvements in the U.S. AE system may provide a systemic benefit to multinational operations.

For the first time since the Korean Conflict, Canadian aeromedical evacuation (airevac) crews have been deployed to a theater of war. While certainly not of the same magnitude as the Korean operation, this deployment has helped us re-learn some of the lessons forgotten in the intervening 40 years, and has reinforced the readiness posture for which we have trained. The vagaries of emergency airlift have brought our airevac mission very clearly into focus.

UNITED NATIONS AEROMEDICAL EVACUATION OPERATIONS IN THE FORMER YUGOSLAVIA

Thornton, W. P., Department of the Air Force, USA; Neubauer, J. C.,

Department of the Air Force, USA; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 8 p; In English; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

This paper examines intratheater aeromedical evacuation of United Nations Protection Force (UNPROFOR) casualties during peacekeeping operations in the republics of Croatia, Bosnia-Herzegovina, and the Former Yugoslav Republic of Macedonia. Its purpose is to inform NATO countries that participate in future UN operations of the inherent deficiencies of the force medical support for such multinational missions. UNPROFOR consists of over 40,000 personnel representing 36 nations organized into at least 37 battalion size units in a widely dispersed deployment. The paper is a summary of observations from the HQ, UNPROFOR Medical Branch compiled from reports, liaison visits to units, and direct participation in planning and training activities for aeromedical evacuation. Effective aeromedical evacuation in this mission was complicated by many factors: lack of dedicated aeromedical evacuation units; difficult weather and terrain; restrictions of flight imposed by warring factions; lack of standardized communications and medical equipment; wide variation in the level of proficiency, training, and experience of various contingents; and lack of standardized international procedures and policies. There is no medical unit in theater to bridge the gap between first level medical units in the field and the level three field hospitals. Accordingly, most NATO member contingents have elected to place field surgical teams at the battalion level. Discussion includes capabilities provided by military and civilian utility helicopter and fixed-wing aircraft. Efforts in training and simplification of procedures for evacuation are also summarized. The limitations of the current system are described, and existing shortfalls are defined with recommendations for future improvements.

The increase in the number of peace-keeping activities of the armed forces, and the continuing pressure on national defense budgets, are making a demand for maximum efficiency. Triservice co-operation between army, navy and airforce is being pushed in all areas (not just in the medical area), as well as international co-operation between services and civil-military co-operation.

A little more than hundred years ago, the injured soldiers were left behind in the battlefield and it was not extraordinary to see wounded still being picked up days after the battle, and then to receive, if they were lucky, only some degree of wound care and lifesaving amputations. Everyone is aware of the changes that have occurred in our society following the scientific achievements of the last century. These technical advances have changed the view of our planet. For the first time we realize not only that we are in the same boat, but that we can change its course. Medicine has not turned its back to these changes. Today's therapeutic possibilities are far beyond the expectations present just a few decades ago. Those can be made available to any wounded or sick, thanks the progress in transportation, mainly air transportation and medical air evacuation. However, two facts have to be taken into account: (1) Warfare, with its everchanging situation and hi-tech weapon systems has developed an enormous destruction potential; (2) Medicine, has become more complex and has to face limited health resources in the military and civilian environment. Medical care and treatment are expensive, complicated and this applies also to med-evac media, especially the ones involved in aeromedical evacuation. Bearing all this in mind, we describe problems encountered with air evacuations during our involvement in multinational forces and make recommendations after their analysis.

It's now well-known the fact that in the last few years a new concept of trauma patient medical assistance is imposing itself in the field of emergency medicine. This is helicopter aeroevacuation, and this together with the appropriate coordination between pre-hospital medical care and intensive care units, is making important changes in the disease and death toll of this kind of patients. The objective of this talk is to transmit the experience of this pre-hospital care service and to evaluate its results and evolution in its first three years of life.

The Gulf War (Desert Shield/Desert Storm) was a military effort involving multinational participation on a scale unparalleled in the history of modern warfare. Numerous countries were involved in the operation--many providing combatants. The nature and scope of the allied involvement led to numerous interoperability issues in many areas, including medical. USA forces were deployed in accordance with an existing operational plan (OPLAN) which had been developed to counter an Iraqi threat to Kuwait and Saudi Arabia. That OPLAN included the development of a theater medical system (TMS) to support all components of the U.S. military. The details of the relationship between U.S. forces and its allies were not part of that OPLAN and evolved as deployment of forces took place. In order to resolve interoperability issues, Friendly Force Medical Conferences were conducted during the course of the war. Senior medical officers from

the allied forces gathered together to resolve areas of concern. There was considerable variation in the medical capabilities of the deployed allied forces--particularly related to aeromedical evacuation.

During the Gulf War 1990/1991 a Boeing 737-300 was leased from a civilian airline company and prepared for aeromedical evacuation of injured allied soldiers from U.S. bases in Saudi Arabia, or from staging facilities in West Germany or England, to Holstebro Military Hospital in Denmark. Additional fuel tanks and military communication, navigational and identification systems were installed. The original interior was replaced with stretcher racks placed along the cabin wall on both sides together with intensive care medical monitoring equipment. Object was to operate 24 hours a day, and three medical crews were established. Patient selection, categorization, prioritization and loading plans would be decided by a Senior Flight Surgeon in a forward position. After 3 weeks, on February 8, 1991 the system was declared operational, and a test flight to Rhein Main AB, Germany was accomplished. Though the system was never activated due to the limited number of casualties, valuable experience was gained, and the system should be considered in connection with future international military operations.

During the last two years, Spain has participated as a part of the United Nations Forces in the former Yugoslavia. The Spanish Forces bore a major responsibility for maintaining the access of relief personnel and supplies to the areas designated to them, especially around Mostar and the Neretva valley. Medical personnel from the Army accompanied these forces establishing certain sanitary objectives and implementing their medical deployment plans. These plans consisted of a small classification post in Dracevo with an ICU with surgical Unit (1 Surgeon, 1 Orthopedist, 1 Anesthesiologist, 1 Intensivist, etc.) a few hospital beds and 4 ambulance teams, each with a doctor and a nurse on board. As the first casualties occurred, the aeromedical evacuation plan was activated (this task was 'commended' to the Air Force Med-Evac Teams). These teams had had some relatively recent experience drawn from operations in Namibia and south-west Asia in the last years. But the real scenario, taught new lessons which had to be assimilated, and the conclusions drawn implemented to improve our operational activity.

The complexity and dynamics of medical evacuation planning - for peacetime, wartime, and disaster scenarios - require decision support aids that provide much more than data base access and spreadsheet solutions. This paper presents an overview of the development and early user operational and technical assessment of a Decision Support System (DSS) that incorporates innovative object-oriented data bases, state-of-the-art mapping capability, and constraint-directed planning technology.

THE IMPACT OF OCCUPATIONAL CULTURES ON COORDINATION OF EMERGENCY MEDICAL SERVICE CREW

Fonne, V. M., Royal Norwegian Inst. of Aviation Medicine, Norway; Myhre, G., Royal Norwegian Inst. of Aviation Medicine, Norway; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 7 p; In English; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

The purpose of the study was to see whether one can observe different occupational cultures in the Emergency Medical Service and whether these differences in orientation among the crewmembers may have an impact on effective crew coordination. The number of crew members is usually limited to pilot, paramedic rescuer and medical doctors or registered nurse. Due to their different professional training, each crew member joins the Emergency Medical Service (EMS) with different backgrounds, interests and expectations. The operational stresses of this kind of service, however, demand team work and expose the crew's ability to coordinate their actions to work as a team. The initial study consisted of 60 operational crewmembers from the Norwegian Air Ambulance Service. They represent 65 percent of the company's flying personnel. Hofstede's Values Survey Module was administered for an evaluation of occupational culture. The analysis reveals group differences at the occupational level in the perception of power distribution, team orientation and achievement preferences. The results are further discussed in relation to the crewmembers' different task demands and areas of responsibility, and emphasis is put on organizational responsibility for enhancing safety and effectiveness in the service.

MEDICAL EVACUATION: A TRAINING PRIORITY

Urbauer, Craig L., Army Medical Command (18th), USA; Granger, Mathew S., Army Medical Command (18th), USA; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 2 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A02, Microfiche

Medical evacuation is a comprehensive process which includes selecting the patients to be evacuated, determining the means of evacuation, and providing enroute medical care and intervention. The military medical community continues to stress the fact that medical evacuation is a medical process, not a logistic one. The 'chain of medical responsibility' is an important principle, but it does not relieve the ground maneuver commander of responsibility for the treatment and evacuation of casualties from the battlefield. Medical treatment and evacuation is a sustainment function as critical to the ground commander's success as arming, fueling, fixing, or moving. If the chain of medical responsibility is to have the proper means to succeed on the battlefield, the ground maneuver commander must establish medical evacuation as a training priority equal to the other sustainment functions.

FLYING AMBULANCES: THE APPROACH OF A SMALL AIR FORCE TO LONG DISTANCE AEROMEDICAL EVACUATION OF CRITICALLY INJURED PATIENTS

Nielsen, J. Nybo, Vaerloese Air Base, Denmark; Lydich, S., Vaerloese

Air Base, Denmark; Larsen, F. K., Vaerloese Air Base, Denmark; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 3 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A02, Microfiche

The Danish Air Force has developed a system for Aeromedical Evacuation of injured soldiers, based on flying ambulances inside a C-130. The ambulances function as mobile intensive care units, and provide a quiet, well lit and air-conditioned environment for observation and treatment of the patients. The system has a limited capacity, but it has so far proved sufficient to support the Danish participation in the UN-peacekeeping missions in the former Yugoslavia. A number of missions have been successfully carried out, three of them with two ambulances in the C-130. The system has the added advantage of providing door to door transport, without the need for moving the patient from ambulance to aircraft, and again from the aircraft to another ambulance on arrival in Denmark. To increase the capacity in the future, a system using specially equipped containers to be carried in the cargo bay of a C-130 is under consideration, and 2 such containers will probably be ordered this year. For the future AIREVAC support of a Danish battalion as part of NATO's Rapid Reaction Forces, we suggest a system based on chartered Boeing 737's or similar aircraft, and reservist personnel which should be identified and trained for the mission. The readiness of the system should be insured through planning, including contracts with airlines and personnel, training of medical personnel and procurement of stretcher support system and medical supplies.

CIVIL RESERVE AIR FLEET-AEROMEDICAL EVACUATION SHIPSET (CRAF-AESS)

Nistler, Candy Jean, Department of the Air Force, USA; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 2 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A02, Microfiche

In 1985, the USAF/SG, AMC/SG, and CINCAMC agreed in time of war there would not be enough C-141's and C-9's that could be dedicated to Aeromedical Evacuation (AE). It was decided to design a kit that could re-configure Civil Reserve Air Fleet aircraft, specifically the Boeing 767, into AE aircraft to perform strategic and CONUS missions. A formal acquisition program was planned and executed by the Human Systems Program Office, Brooks AFB, TX, to design, develop, and produce the conversion kit for the Boeing 767. Developmental and Operational Test Evaluation Flights were flown in March 1991. The FAA issued flying certificates for two configurations of the Boeing 767 conversion kit; one to carry 111 litter patients and one to carry 87 litter patients. The CRAF-AESS has three subsystems. The Patient Transport Subsystem (PTS) consists of the litter stanchions and litter support arms for up to 111 litter patients. The Medical Oxygen Subsystem (MOS) consists of six 75 liter Dewars, which supply therapeutic oxygen outlets located at each potential litter position. The Aeromedical Operations Subsystem (AOS) consists of six 35 amp electrical converters to convert aircraft power to regular hospital current for medical equipment use. Electrical outlets are located at each potential litter position. This subsystem also includes two nurse workstations and seats. The airlines signed a contract with the USAF to be a CRAF-AESS supporter. Civilian airline pilots will fly the CRAF-AESS aircraft, airline flight attendants will be in charge of emergency egress, and the Systems Program Office is currently in full production for 44 shipsets. There are 17 complete shipsets delivered to date. CRAF-AESS will expand the USAF AE capabilities during war and allows medical personnel to provide excellent medical care.

FIRST MEDICAL TEST OF THE UH-60Q AND EQUIPMENT FOR USE IN US ARMY MEDEVAC HELICOPTERS

Bruckart, J. E., Army Aeromedical Research Lab., USA; Licina, J. R., Army Aeromedical Research Lab., USA; Quattlebaum, M. D., Army Aeromedical Research Lab., USA; AGARD, Recent Issues and

Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 5 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A02, Microfiche

The U.S. Army operates helicopters worldwide, including over 500 designated for medical evacuation (MEDEVAC). Advanced avionics and a commercial medical interior have been installed in a Black Hawk helicopter, designated the UH-60Q. MEDEVAC aircraft also carry commercial medical devices that can fail from stresses of in-flight use or interfere with critical rotary-wing aircraft systems. The U.S. Army Aeromedical Research Laboratory (USAARL) performed the first flight tests evaluating the medical interior in the UH-60Q and tested commercial medical devices to determine their compatibility with MEDEVAC aircraft. Flight tests in the UH-60Q validated the enhanced capability provided by the new avionics systems, external rescue hoist, oxygen generator, built-in suction, litter lifts, and improved crew seating. The new litter lift system provided inadequate vertical clearance and several components of the restraint hardware were not sufficiently durable. From January 1989 to January 1994, 40 medical devices, including monitor/defibrillators, infusion pumps, vital sign monitors, ventilators, oxygen generators, and infant transport incubators, were tested under extreme conditions of temperature, humidity, altitude, and vibration (MIL-STD 810). Electromagnetic emissions and susceptibility were measured (MIL-STD 461 & 462). Thirty-two percent of the medical devices failed at least one environmental test and 92 percent of the devices failed to meet electromagnetic interference standards. Eighteen percent of the commercial medical devices were judged unsuitable for use in the UH-60 MEDEVAC helicopter. Testing is critical to discover the ability of a new aircraft system or medical device to perform in the harsh rotary-wing MEDEVAC environment. Failure of a device or interference with aircraft systems can result in loss of a patient or aircrew.

THE LARGE-CAPACITY RESCUE-HELICOPTER CH-53 G**

Schroedl, Christoph, Army Aviation Brigade, Germany; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 3 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A02, Microfiche

A new concept has been developed: (1) for handling great numbers of casualties during disasters and events entailing major damage; (2) for providing quick support of medical treatment facilities employed by crisis reaction forces during out-of-area operations; and (3) for accomplishing medical evacuation and combat rescue missions. In view of current planning conducted by the German armed forces in conjunction with the crisis reaction forces this concept takes on an increased tactical significance in the context of studies concerning medical support of medical treatment facilities and also when it comes to missions related to combat rescue and medical evacuation. During several real-time operations and numerous exercises the 'large rescue helicopter CH-53 G' concept has proved to be efficient.

INTERNATIONAL ACCESS TO AEROMEDICAL EVACUATION MEDICAL EQUIPMENT ASSESSMENT DATA

Hale, Jacqueline, Department of the Air Force, USA; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 3 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A02, Microfiche

Aeromedical evacuation medical equipment development using evaluation and often times modification by the manufacturer to achieve compatibility in the airborne environment began over 25 years ago at Brooks AFB in support of Military Airlift Commands (now Air Mobility Command) medical evacuation mission. This approach was adopted because sometimes standard research and development methods were not responsive to Command requirements. In the course of those years simple items such as securing devices to those as complicated as an Extracorporeal Membrane Oxygenation System have been extensively evaluated using a battery of tests to verify adapt ability to altitude and compatibility with aircraft systems. Because

technology in aircraft systems and in medical equipment has advanced, so has the importance of testing for situational compatibility. Medical devices may produce electromagnetic interference with aircraft navigation or communication systems and aircraft systems can interfere with the operation of medical devices. Results of tests conducted at Armstrong Laboratory Brooks AFB are published as individual detailed Technical Reports and later compiled into a comprehensive document entitled 'Status Report on Medical Material Items Tested and Evaluated For Use In The USAF Aeromedical Evacuation System'. This publication was available for public release and met customer access needs of the day. However, with the advent of independent air ambulance services and increase in countries actively engaged in aeromedical evacuation, a need to better communicate results of testing emerged. Researchers at Armstrong Laboratory developed a database program for rapid dissemination of medical equipment airworthiness evaluation results and are exploring electronic delivery avenues to meet the need for worldwide accessibility.

CHANGES IN THE MEDEVAC MISSION RESULT IN AN INCREASED ROLE FOR THE FLIGHT SURGEON

Lyons, T. J., USA Air Forces in Europe, USA; Connor, S. B., USA Air Forces in Europe, USA; AGARD, Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC); Feb 1, 1995, 10 p; In English; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

Historically physicians were involved in the development of aeromedical evacuation (medevac) and flight surgeons flew as crewmembers on the first US military medevac flights. However, since World War II flight surgeons have not been routinely assigned to operational medevac units. The aeromedical literature addressing the role of physicians in medevac is controversial. Recent contingencies involving the U.S. Air Force (USAF) have required the augmentation of medevac units with flight surgeons. Since 2 February 1993, USAFE has moved 221 patients on 27 missions out of the former Yugoslavia -- most of these missions had a flight surgeon on the crew. Because advanced medical information on the status of these patients is often non-existent, the presence of a physician on the crew proved life-saving in some instances. In peacetime operations, there has been a recent trend in the European theater for the USAF to move more unstable patients. Beginning in 1993, USAFE assigned three flight surgeons to the medevac squadron. Dedicated medevac flight surgeons have proven to have the specific experience and training to perform effectively in the role of in-flight medical attendant. Their understanding of the system also makes them more effective in medical validation than non-medevac flight surgeons. In addition, they are effective in negotiating with referring physicians about the urgency of movement, required equipment, the need for medical attendants, etc. These flight surgeons provide medical coverage of transiting patients in the Aeromedical Staging Flight (ASF), thus providing needed continuity in the medevac system. In conclusion, dedicated medevac flight surgeons fill a unique and valuable role. Recommend that agencies with medevac units consider assigning flight surgeons to these units.

OPTIMUM ROUTING: ANALYTICAL CONSTRAINT OF SEARCH SPACE

Sample, W. G., British Aerospace Aircraft Group, UK; AGARD, Low-Level and Nap-of-the-Earth (NOE) Night Operations; Jan 1, 1995, 10 p; In English; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Algorithms are being developed for route optimization using the geometric constraints imposed on route geometry by zero-gradient conditions on route costs. Two related techniques are under consideration. The first takes a spatial search approach using the geometric constraints to guide the search. The second uses the errors in the constraint equations on a given path to derive an iterative correction. The first technique itself divides into free, or path-aligned propagation, and bound, or grid-aligned propagation. The former enables removal

of many terms in the equations, the latter removes the need for complex geometric housekeeping. To date, the techniques have been coded for two-dimensional scalar isotropic cost functions. Work is in hand to progress this to non-isotropic and multi-dimensional cases, especially to cater for representative threat tracking and missile characteristics and for fuel consumption. Results from the code produced so far are extremely encouraging. The principles have been shown to be sound, and full spatial search achieved without combinatorial explosion of computing demand. Fine-grain searches of sizable grids have been completed in less than half a second on a workstation of modest performance. 'Real' cases will in general require dynamic cost density and derivative calculations. Conventional methods can deliver these at sufficient granularity and at a sufficient rate for the present search methods, given that there appears to be scope for the average granularity in the method to be coarsened considerably. For refinement of coarse-grained search output, a fast iterative scheme has been produced. Subsequent development will address extending its stable range of usability.

A TACTICAL NAVIGATION AND ROUTING SYSTEM FOR LOW-LEVEL FLIGHT

Hewitt, C., GEC-Marconi Avionics Ltd., UK; Broatch, S. A., GEC-Marconi Avionics Ltd., UK; AGARD, Low-Level and Nap-of-the-Earth (NOE) Night Operations; Jan 1, 1995, 10 p; In English; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

Many types of offensive air operations need to be carried out at low level in order to ensure survivability and to maximize the probability of mission success. However, such a flight trajectory is workload intensive and leaves little room for pilot error. It would be highly beneficial if the activities of in-flight route planning, obstacle, threat and terrain avoidance, and time and fuel monitoring could be automated. This paper presents an integrated solution to this automation problem based on the effective exploitation of terrain and mission databases. The requirements of the component parts of this system are presented. These include: (1) an optimum routing algorithm, together with the criteria used in selecting the optimum four dimensional route for all mission scenarios; (2) a ground and obstacle collision avoidance system which enables the pilot to fly low, while providing timely warnings of imminent high terrain and obstacles; and (3) the navigation accuracy required to support the optimum routing and collision avoidance systems. The paper then describes a number of systems that have been developed by GEC-Marconi Avionics with the support of the Defence Research Agency (DRA), UK Ministry of Defence. The first is an optimum routing algorithm which uses terrain and mission databases to generate an optimum route, taking account of threats, terrain, obstacles, time and fuel constraints. A description of a predictive Ground and Obstacle Collision Avoidance Technique (GOCAT) is then presented. This uses a terrain and obstacle database to assess whether the current and future aircraft trajectory is safe. Finally the navigation requirements to support these systems are discussed and a solution based on integrated INS, GPS, Map Referenced Navigation (MRN) and Edge Detection Navigation (EDN) is described.

THE APPLICATION OF HELICOPTER MISSION SIMULATION TO NAP-OF-THE-EARTH OPERATIONS

Birkett, P. R., Defence Research Agency, UK; Roden, D. W., Defence Research Agency, UK; AGARD, Low-Level and Nap-of-the-Earth (NOE) Night Operations; Jan 1, 1995, 5 p; In English; Copyright; Avail: CASI; A01, Hardcopy; A03, Microfiche

This paper describes some of the system trade-offs and integration issues associated with the next generation of battlefield helicopters operating in the NOE environment. The interactions between weapons, sensors, aircrew and the platform itself are discussed and their influence on the effectiveness of the helicopter as a total system

is considered. Finally, an approach to the study of helicopter system integration is presented. The 'multipleman-in-the-loop' mission simulator, HOVERS, is described and its application to a typical trade-off issue discussed.

AN INTEGRATED SYSTEM FOR AIR TO GROUND OPERATIONS

Avale, Massimo, Alenia Aeronautica, Italy; AGARD, Low-Level and Nap-of-the-Earth (NOE) Night Operations; Jan 1, 1995, 10 p; In English; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

The following paper describes, at the conceptual level, a possible solution for a system able to meet the hard requirements for attack A/Cs operating at low level into a high threat density scenario. The conceptual study related to this work takes place from a research program related to air to air engagements, as some concepts mainly related to pilot workload reduction can be tuned up air to ground missions. A research program to deeply analyze the more important functions related to the safe penetration concept could be initiated from this work. Some of the main concepts related to low level A/C operations are overview and possible enhancements related to the technology trend and to possible new functions derived from enhanced system integration are discussed as an introduction for the system description. The main functions forming the system will be described and an overview about the possible involved technologies will be supplied.

COVERT NIGHT/DAY OPERATIONS FOR ROTORCRAFT (CONDOR) PROGRAMME

Southam, T. H., Defence Research Agency, UK; AGARD, Low-Level and Nap-of-the-Earth (NOE) Night Operations; Jan 1, 1995, 16 p; In English; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

CONDOR is a major joint US-UK project that will support a comprehensive demonstration of the functionality of current and future attack helicopters under day/night adverse weather conditions in a nap of the Earth environment. The aim of the program is to investigate the integration of a suite of avionics, sensors and displays for battlefield helicopters and to assess their effectiveness during ingress, egress and attack phases of the mission. The concept features a precision navigation system which together with a steerable sensor coupled visually, via a helmet-position sensing system, to an advanced helmet mounted display with a wide FOV, full colour and laser eye protection enables a virtual outside world overlaid with appropriate flight and mission information to the pilot. The program includes development and building of the advanced hardware, research into the human factors issues connected with their exploitation, symbology development coupled to a detailed application in a full mission scenario. Flight demonstrations are scheduled to take place in both the Lynx at DRA and, with subsequent testing in the U.S., to exploit a new full-authority FBW flight control system with mission configurable control laws.

The increasing use of joint service, coalition forces to support modern warfare continues to magnify the importance of superior and flexible tactical command, control, communications, and intelligence

(C3I) systems. Interoperability has become a commonly identified key component in the success of this modern warfare. In this context, interoperability can be defined as the capability for two or more C3I systems to share and manage common information to maximize the operational effectiveness of the combined force. Examples of common interoperability problems experienced during a number of military operations and exercises are described. Potential short and long term interoperability solutions, particularly in the areas of data communication, data fusion, and data management are presented.

Adaptive strike missiles have the capability to autonomously find and attack targets. In many cases, the location of the target is not known, and the missile must perform a search of the region in order to detect any existing targets. This search entails the planning of a search flight path, tailored to the sensor's capabilities, that will maximize the probability of detection. The Search Planner is composed of a search path subsystem that includes: (1) a tactical motion analyzer that takes into account terrain and feature data, and determines a probable search region based on the motion capability of the target; (2) a feature extractor subsystem which generates most-likelihood feature maps, such as tree-lines, that govern possible target locations within the critical region; (3) a path generator subsystem that determines the best search path by first covering the possible target locations with rectangular strips and then chaining them together in a near-optimal way; and (4) a sensor manager that optimizes allocation of sensor resources as the missile travels through the search region. To validate our concept, we have integrated the Search Planner into a many-on-many simulator that functions to optimally allocate a missile strike force en-route. This paper describes the design of the Search Path Planner subsystem which consists of a Search Area Generator, a Segment Generator, a Link Generator, and a Link Chainer module.

THE NEED FOR PRECISION-GUIDED MUNITIONS IN LIMITED CONFLICT: AN OPERATIONAL VIEWPOINT

Hall, Ian, Supreme Headquarters Allied Powers Europe, Belgium; Jun. 1996; 6p; In English; See also 19960053042; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

A missed air-to-ground attack is never welcome by an operational commander; collateral damage and the increased possibility of attrition engendered by the necessary re-attack are but two of the likely, undesirable results. The effects may assume increased significance in a limited conflict, where political factors may bear relatively more heavily than in general war. Thus precision guided munitions (PGM) may be a highly desirable option. In the purely military sense, conditions prevailing on the less-dense battlefield may tend to present particularly favorable conditions for the employment of precision weapons; however, there may be counter arguments, and occasions where PGMs are not the best option. This paper offers examples from recent conflicts to support the general case for PGMs, before going on to discuss advantages and disadvantages of generic types of weapons. Finally, while acknowledging that nations are unlikely ever to procure weapons specifically for limited conflict, it discusses the ideal stockpile for small-scale operations. In doing so, it raises the point that characteristics of the target identification and designation system are likely to be at least as significant as those of the weapon itself.

Technologies introduced into the military helicopter which represent a rapid reaction potential are described. These include: air mobility including the capability of operating without airfield infrastructures, night vision for around the clock operations, fire power based on the integration of aircraft and weapons with system architecture. When combined with helicopter borne command, control and communications and intelligence (C3I) these technologies constitute an air mobile task force able to conduct airstrikes. This paper introduces the principles and techniques of air mobile operations, then applies these considerations to a realistic scenario, and fully details the technologies used to achieve the required precision.

Precision guided weapons that employ advanced imaging infrared seekers, data links, and mission computers require detailed mission planning and rehearsal systems to ensure mission success. The cost to develop these weapons and mission planning systems are rapidly increasing as advanced signal processing algorithms are employed to increase the probability of target detection, acquisition and recognition, with the ultimate goal of accurate target tracking and precise aimpoint selection for maximum probability of kill and minimum collateral damage. This paper presents a real-time Precision Imaging

Strike technology Integration Laboratory (PISTIL) which provides precision guided weapons developers with many of the tools and data to answer key questions.

In future weapon systems, accurate target selection and location is required to maximize warhead effectiveness and minimize collateral damage. To help achieve this there should be available significant information about the target location from a variety of sources, e.g., satellite imagery, surveillance data and intelligence information. On board the vehicle there will normally be a navigation system which has a good estimate of its position and often there will be an electro-optical (E-O) sensor which produces imagery of the terrain ahead and the target. There is also available an increasing level of computational power and software techniques including fast image processing systems. Using a model from a prepared database of terrain features matched to features extracted from such an image, it is possible to estimate the sensor position and hence the target position. We discuss here a 'proof of principle' system which demonstrates a robust mechanism for achieving this. We describe an implementation using data gathered from a camera moving across a terrain model and results are presented.

The goal of this paper is to familiarize the reader with the major image and video compression technologies in the context of weapons control (WC) and bomb damage indication (BDI) applications. Towards this goal, we discuss the operation and limitations of the four major still image compression techniques: discrete cosine transform (DCT), wavelet transform, vector quantization, and fractal. We then consider the broader problem of implementing video compression

algorithms which use the previously discussed still image compression algorithms as basic building blocks. Some of the techniques examined here are motion estimation, motion compensation for prediction and interpolation, and 3-dimensional subband coding. Finally, we discuss the major characteristics of digital video compression and transmission systems, concentrating on the impact they have on WC and BDI system performance. Many of these characteristics are desirable in every compression application (e.g. good image quality) but some of them are especially important for low-cost remote-sensing platforms (e.g., a low-complexity video encoder). In addition, some characteristics like video latency are important for the weapons control application but not for the BDI application. Within this framework, we discuss the various images and video compression technologies available and highlight those which are particularly good or bad for WC/BDI applications.

Infrared sensors have been integrated on military aircraft for over 20 years. Among them, are forward-looking infrared sensors (FLIR), generally installed in the navigation pod. These are dedicated to night flying and designation pods, used in the terminal phase of air to ground attack. While the need for night time navigation exists in order to ensure around the clock air treats, it has been determined that the generalization of infrared system has not been implemented in military aircraft. Technological evolution has recently led to the use of high performance sensors, which take up a reduced amount of space, and therefore can be integrated into the airframe, and are capable of fulfilling two basic mission functions: navigation and attack. The appearance of new generation optronic imagery which uses infrared charge coupled device (IRCCD) detectors therefore allow for important advances in air to ground strike missions. The purpose of this article is to specify principles and characteristics of the IRCCD sensors used in France, and their contribution during a night mission. To do this, the following studies carried out by SAGEM with the support of the State Services Branch are described: the IRIS thermal camera, integration achieved on the Mirage 2000 aircraft, night piloting systems, navigation recomputation methods using infrared imagery, and contribution pertaining to air-to-ground night attacks.

ESTIMATING THE TRAINING EFFECTIVENESS OF INTERACTIVE AIR COMBAT SIMULATION

Wang, Wayne L., Armstrong Lab., USA; Bell, Herbert H., Armstrong Lab., USA; Apr. 1996; 12p; In English; See also 19970000594; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

This paper is concerned with the general problem of measuring the value of simulation for combat mission training. There are a number of engineering efforts currently attempting to develop multi-player, virtual simulations that will allow soldiers, sailors, and pilots to interact with one another in a synthetic battlefield for combat mission training. This paper will briefly discuss the continuation training environment that simulation must effectively complement and the various approaches for obtaining training effectiveness data for estimating the training payoff of these efforts. It will then summarize the results of recent efforts conducted by the Armstrong Laboratory to assess the

value of combat mission simulation for continuation training of pilots. Although the results of these studies indicate high user acceptance for simulation and improved performance during the course of simulator-based training, transfer of training data has yet to be obtained.

Increased weapon sophistication, interaction between different weapon capabilities, and increased weapon cost have led to increased reliance on large scale multiple objective test and training exercises. This combination can simultaneously obtain high value training and weapons test data with minimum expenditure of weapon assets. This paper details the experience of Utah Test and Training Range (UTTR) in reporting increasingly sophisticated weapons test and training programs conducted by the U. S. Air Force. Objectives, procedures, and test equipment used by such Air Force Air Combat Command programs as the Weapon Systems Evaluation Program (WSEP) and Conventional Air Launched Cruise Missile are discussed. WSEP tests multiple precision guided munition types, including the sophisticated High Speed Anti-Radiation Missile (HARM), Maverick, and Have Nap missiles. All tests are conducted using aircraft and aircrews from operational units in a realistic 'war game' environment against realistic targets to provide unmatched training for multiple fighter and bomber squadrons. Fiscal year 1994 WSEP tests involved nine fighter units and over 150 weapons at UTTR. Strategic and tactical cruise missile tests are also conducted using operational aircraft, crews, and equipment flying long range routes simulating wartime requirements. Simulated missile launch areas add operational realism. Missile profiles are designed to exercise missile launch, enroute guidance, and terminal attack capabilities. Weapons data are collected and used to evaluate accuracy, effectiveness, and reliability. Methods, procedures, and test range equipment used by UTTR to support tactical missile tests are discussed. Constraints necessary to meet range safety requirements are discussed, as well as methods used to minimize the constraints.

THE FUTURE FOR UAVS IN NATO

Michelson, Robert C., Georgia Tech Research Inst., USA; Nov. 1996; 5p; In English; See also 19970018626; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

The face of NATO is changing in the light of the demise of the Soviet Block, however the need for NATO is perhaps more critical today than ever before due to the fragmented warring factions that have arisen in the absence of the stabilizing oppression of the Soviet Union and the Warsaw Pact. Unfortunately, these changes are occurring in the face of a global recession that has prompted the Nations to reconsider past levels of military spending. The demise of the Soviet Union is viewed as a reason to draw down forces and rely on existing (and sometimes antiquated) defense infrastructures. Advances in machine intelligence and robotics can be leveraged to offset the negative impact of economically-induced factors affecting the Nations' forces during the next decade. Particularly in the areas of reconnaissance, intelligence, early warning, and even certain lethal operations, the use of Unmanned Aerial Vehicles (UAV) is predicted to be a major factor in the maintenance of an affordable military presence. Low intensity conflicts along the borders of the Nations (as already witnessed in Bosnia) are expected to continue. Coupled with the need to continue certain NATO activities more effectively, is the occurrence of expanded missions that will arise due to increased trade in contraband as the Economic Community facilitates a more open Europe. Both land-based and maritime UAVs have a definite place within the NATO infrastructure, but currently the individual Nations do not have

a clear or unified road map to define their use. Given a coordinated plan for the use of UAVs by the Nations, what critical technologies must be put in place over the next few years to allow UAVs to meet the challenges of the missions expected by the year 2000? How will the predicted burgeoning of the commercial market for UAVs by the year 2000 affect NATO interests in this technology, and how can NATO leverage this commercial market for its own benefit? This paper will identify both the military and commercial UAV missions expected by A.D. 2000. The analysis will consider the particular regional requirements posed by the geography of the member nations.

Lessons learned, both in development and operation, of rotary wing UAVs over a period of some 25 years are described. In particular it has been found that air vehicle compactness and vertical flight capability offers operational versatility not available to fixed-wing systems. There is no cost or reliability penalty to pay for this though design must take account of the dependence of the VTOL UAV on an accurate height sensor and the demands of scale (compared with manned systems) on the technology.

Modern drones represent robotic systems which pick up situations in their environment by sensor payloads, assess them by preprogrammed mission logic and react according to their predefined mission. Some functions of the air vehicle may be controlled or supervised interactively by operators from a ground control station. Typical tasks for drone systems are: reconnaissance; surveillance; target localization; electronic warfare; target combat in adverse environmental conditions, e.g. considerable threat by enemy air defence systems (ADS). The different tasks lead to two major designs for the air vehicle: the reusable drone, e.g. for reconnaissance and the expendable / fire and forget drone, e.g. for combat missions. These design criteria determine the range of the necessary ground equipment, e.g. for drone refurbishing, number of staff as well as the training effort. Due to the threat by ADS, the drones should have low signatures in the frequency bands of visual, infrared, acoustic and radar sensors to minimize the probability of being detected and jammed or shot down.

MULTIPLE UMA'S IN-FLIGHT MANAGEMENT

Siardi, Carlo, METEOR Costruzioni Aeronautiche ed Elettroniche S.p.A., Italy; Nov. 1996; 14p; In English; See also 19970018626; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Up to now significant effort has been posed in exploiting the basic UMA functionalities and operational growth potentials: almost all issues concerning single UMA employment are currently being addressed and solutions are due to come. Instead, Multiple UMA's control and operational Management (MUM) is still an open issue which has to pass through accurate and comprehensive operational scenarios evaluation and thus ending up with proper requirement definition. The present paper deals with this latter statement, also trying to outline potential problems which may arise operationally. Among the many parameters involved, timing is going to be the key parameter to

handle, in order to allow full UMA utilization within multi-forces operations. As far as multiple UMA's controlled by a single GCS are concerned, this issue can be translated in how accurately the time windows tied to each navigational waypoint are intercepted by the in-flight air-vehicles. Therefore the question moves to which parameter must be controlled by the UMA Flight Management System and how is it influenced by the en-route wind. Another intriguing subject is closely connected to the link band employed: provided satellite links represent a viable and effective solution, we hereon limit are discussion to conventional ground links. In case of NATO standard J-Band link a narrow beam is necessary due to the band typical fading margin and energy losses. Since a GCS has to cope with several UMA's performing their missions, an accurate trade-off must be conducted to establish a proper balance between several basic parametric constraints, such as ground antenna beam width, spatial air-vehicle navigational accuracy, Ground Data Terminal antenna stabilization, GCS Man Machine Interface and so on, in order to guarantee a reliable air-vehicle acquisition for proper tracking and data gaining. Moreover, link loss and failures management during silent flight are going to be tough subjects to cope with, for they represent potential hazards within airspace control activities. Last but not least is how to demonstrate the fulfillment of the requirements, keeping an eye on testing costs and risk reduction.

Unmanned Aerial Vehicles have a definite potential for civilian observation and reconnaissance missions such as forest fire detection or coastal waters surveillance. For a decision to use such vehicles in significant numbers to be taken, once the adequate legal framework is defined, they must be easy to operate at a low cost. The ARMOR project aims at developing such a vehicle. The ease of operation requires that the vehicle is sufficiently autonomous to perform most of the mission without the contribution of an experienced pilot. To achieve this degree of autonomy it must have a reliable Vehicle Management System (VMS) capable of dealing with both normal and anomalous situations. A structure for the VMS is presented and the work being done in fault detection is presented. The vehicle will have to be extensively tested, increasing progressively its complexity, starting with a simple guidance system and finishing with the full VMS. This means that the guidance system is one of the first to be developed. The work being done for this system is also presented. The guidance system has to be highly reliable but simple for low cost. For the types of operation envisaged, precision is not a very stringent requirement. As a whole, simplicity induces lower costs but also lower precision. One of the objectives of the work being done is to define the minimum amount of information on the flight path compatible with guidance system efficiency. Some of the results obtained so far are shown and discussed.

The system for alerting naval personnel in the defense of surface vessels against low and very low missiles is described. It is supported by the original concept of premature warning using automatic

unmanned aerial vehicles (UAV). A command logic for each UAV which accounts for different constraints (no collision with other UAVs, displacement of the surface vessels) is presented. It uses the theory of fuzzy logic. An informative simulation accomplished by THOMPSON-CSF permits obtaining results which prove the concept to be very promising. The results and various proposals are presented. Transl. by SCITRAN

Phoenix is the British Army's Battlefield Surveillance and Target Acquisition System in support of medium range artillery including MRLS. Unmanned Air Vehicles carrying Thermal Imaging sensors are controlled from a Ground Control Station (GCS) via a data link. This data link also sends real time thermal imagery to the GCS for analysis and fall of shot adjustment. Surveillance reports, target marks and fall-of-shot adjustments can be sent to the Fire Distribution Centre or direct to gun batteries via the Battlefield Artillery Target Engagement System (BATES). This paper briefly describes the system, outlines a typical mission, covers the integration, testing and evaluation of the system.

The unmanned aerial vehicle (UAV) system CRECERELLE for reconnaissance, surveillance, and acquisition of targets, conceived and developed by the SAGEM group is in operation with the 7th Artillery Regiment. In numerous aspects, the system departs from the characteristics of previous systems. This departure is the result of new operational exigencies and a new geopolitical context which leads to the development of a primary system of robot reconnaissance based on recent technologies. The CRECERELLE system has been conceived as being in first place as a method for collection and processing of schematic information composed of a central unit - the ground station - associated with the gathering and processing of information and dissemination to fields of conflict. This equipment, representative of the advanced technologies developed for CERCERELLE, is described in this article.

The role of the helicopter in military operations often involves flight in adverse weather conditions and the execution of flight maneuvers designed to maintain minimal exposure to the enemy. This translates into a requirement for helicopters to fly very low level, nap-of-the-earth, at night or in bad weather. This type of flying places a high demand on the pilot to accurately perceive the environment and to precisely control the flight path of the aircraft.

INFORMATION: THE WARFIGHTER'S EDGE. THE JOINT STRIKE FIGHTER (JSF) AND SYSTEM-OF-SYSTEMS (SOS)

Williams, Michael A., Lockheed Martin Tactical Aircraft Systems, USA; Collier, Larry G., Lockheed Martin Tactical Aircraft Systems, USA; Jul. 1997; 12p; In English; See also 19970029347; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Complete autonomous mission capability for tactical aircraft is no longer affordable nor necessary in view of the SoS concept. The JSF will rely upon national, theater, and tactical-level ISR to provide long-range target detection, location, and identification. Onboard systems will employ cues from the off-board collectors but will still be required to provide targeting and weapon employment capability as a result of latency and accuracy issues with ISR collectors. However, the resulting JSF on-board sensors will be much less complex in terms of power-aperture product, aperture complexity and/or system sensitivity: the current cost drivers in avionics. Total weapon system performance will be maintained through correlation and fusion of off-board information with onboard sensor data. In effect, off-board data, correlation, and fusion technology will enable a smaller and less complex on-board sensor system to perform like that of a much higher performance/cost system. Use of wingman data will allow on-board systems to be designed for less severe simultaneous mode capabilities. Lower cost, non-interferometer, apertures on multiple aircraft will be managed to provide highly accurate range and bearing data. The implementation of a SoS concept will enable an affordable JSF which can be procured in large enough numbers to replace end-of-life aircraft for the US and NATO allies.

DEPARTMENT OF DEFENSE PERSPECTIVE ON OPEN SYSTEMS ARCHITECTURE

Logan, Glen T., Office of the Under Secretary of Defense (Acquisitions), USA; Jul. 1997; 8p; In English; See also 19970029347; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Due to down sizing of the U.S. defense budget, Department of Defense (DoD) does not have the resources to 'go it alone' anymore. This situation warrants closer cooperation among the DoD services, the industrial base and our allies. There is much to be gained from the wealth of technology available from the commercial sector, especially in electronics for telecommunications, computing, display, sensing and signal processing. For these reasons, among others, recent DoD policies have placed emphasis on performance specifications and standards as opposed to using military specifications and standards. The DoD open systems initiative supports this new emphasis and the five 'pillars' in transforming acquisition as delineated by the Honorable Paul Kaminski, Under Secretary of Defense for Acquisition and Technology: (1) Right Size Our Infrastructure (2) Reduce Cost of Weapon System Ownership (3) Implement Acquisition Reform (4) Leverage the National Industrial Base (5) Leverage Our Allies' Industrial Base The use of an open systems approach is motivated largely by the need (and the opportunity) to reduce the cost of ownership of weapons systems. Open systems are not the objective, rather an open systems approach is a means for program managers and their integrated product teams to achieve their fundamental program objectives of lower life cycle cost and improved performance. Open systems electronics applications include mechanical form factors, power supplies, radio/intermediate frequency (RF/IF) interfaces, and thermal management. An open systems approach uses widely accepted, public consensus standards, that any vendor can use as the basis for system design. Having already proven itself in commercial telecommunications and computing, an open systems approach has been used successfully by the military Command, Control, Communications, Computers and Intelligence (C4I) community and is now being implemented in the weapons systems acquisition community through the Open Systems Joint Task Force (OS-JTF). This paper will focus on the OS-JTF efforts to develop the foundations of open systems for weapon systems electronics.

RAPID TARGETING AND REAL-TIME RESPONSE: THE CRITICAL LINKS FOR EFFECTIVE USE OF COMBINED INTELLIGENCE PRODUCTS IN COMBAT OPERATIONS

Searle, Danny, Naval Air Warfare Center, USA; Kirchner, Rick, Naval Air Warfare Center, USA; Fincher, Ted, Naval Air Warfare Center, USA; Armogida, Frank, Naval Air Warfare Center, USA; Jul. 1997; 8p; In English; See also 19970029347; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

A variety of advanced technology projects have demonstrated the key components required to provide rapid targeting for a real-time response. Forward Hunter (led by NAWCWPNS) and Goldpan (led by the Air Force's Aeronautical Systems Center) are examples of Real-Time Information into the Cockpit/Offboard Targeting (RTIC/OT) demonstrations. These programs have shown the value of providing real-time mission updates (based on national offboard signals and imagery intelligence) to shooters pursuing time-critical targets. All these programs employed national exploitation systems and source material products to show that RTIC/OT can increase mission effectiveness, enhance survivability, and increase operational flexibility against time-critical fixed and mobile targets. Each demonstration has focused on different aspects of critical offboard targeting technologies, such as multisource national/theater intelligence fusion, rapid targeting, near-real-time mission replanning, data dissemination, and onboard processing.

DESIGN OF MISSION MANAGEMENT SYSTEMS: TECHNICAL AND METHODOLOGICAL APPROACHES CONCEPTION DES SYSTEMES DE GESTION DE MISSION: APPROCHES TECHNIQUE ET METHODOLOGIQUE

Sassus, P., Sextant Avionique, France; Bonhoure, F., Sextant Avionique, France; Mariton, T. L., Sextant Avionique, France; Jul. 1997; 12p; In French; See also 19970029347; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

On the strength of its competence in the field of traffic control and, more particularly, traffic management, especially regarding major programs involving combat aircraft, such as Mirage 2000 and Rafale, SEXTANT Avionique has for several years been interested in the development of mission management systems, permitting complete consideration of real time in the development of the operational context (tactical environment, weather, aircraft). For the purposes of defining suitable on-board operation, expert reports were received from operations personnel of the Air Force and the Navy; these made it possible to determine its role, field of use, its performance level (in terms of response time, etc.), of man-system interaction, and pertinent reconfiguration strategies.

MISSION PLANNING SYSTEMS: CUBIC MULTIPLIERS

deMoel, R. P., National Aerospace Lab., Netherlands; Heerema, F. J., National Aerospace Lab., Netherlands; Jul. 1997; 8p; In English; See also 19970029347; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

A system that allows all the available and pertinent information to be used to plan a mission to achieve certain objectives in an optimum and near optimum way, and also data that describes the mission to be loaded into the aircraft. With respect to objectives, operating and technology mission planning systems can be considered as multipliers. This paper discusses some topics related to these multipliers. The National Aerospace Laboratory NLR, in The Netherlands, has a long time experience in development and production of military aircraft mission planning systems. In 1975 already NLR studied the feasibility of 'rear-port tube' graphic display systems for mission planning purposes. This type of display system provided the capability to project map information via a rear-port on the innerside of the display screen, so the screen itself could be applied to compose and show an overlay on the projected map. However, inadequate positioning accuracy of the overlay on the map with respect to navigation requirements made this rear-port tube graphics technology unfeasible for military aircraft mission planning systems. NLR's assessment of technology improvements is part of the section on technology. The most prominent multiplier is directly related to the mission objectives. Awareness of the actual battle theater and several types of advices (weapon - to - mission objectives suitability, minimum risk route, attack maneuvering etc.) are improving principally and practically the chances on mission success. Section 2 of this paper highlights two ingredients of this multiplier: - in the framework of interoperability the standardization of data exchange; in the framework of user friendliness a user definable electronic continuous map area. The second multiplier is the capability of mission planning systems to play a role in the training of military pilots with respect to the execution of real missions. To make this multiplier effective three conditions have to be fulfilled: - the mission planning system supports all mission types due to be exercised; - a metric system is available to assess the planned and sometimes also executed missions in detail; - fake realistic battle theaters are composed in such a way that progress in training can be determined. This second multiplier will be discussed in section 3. Mission planning systems are driving the technology: the third multiplier. Routing systems need always geographic/topographical/reconnaissance information and this information mass is e.g. driving storage capabilities, data compression techniques, and remote sensing derivatives. This subject will be discussed in section 4.

Volume 2, the main volume, of the report of the NATO Advisory Group for Aerospace Research and Development (AGARD) study: 'Aerospace 2020'. This study explored the most advanced technologies, relevant to aerospace, being researched and developed in laboratories today. The study focused on the most promising current technologies and the organizational and tactical consequences they will have at the field and system levels, over the course of the next 25 years. Topics include: a discussion of the impact of proliferation, human-machine interaction, synthetic environments, directed-energy weapons, information technologies, unmanned tactical aircraft, sub-orbital launchers, hypersonic missiles, and a discussion of affordability issues. Technologies are assessed from the viewpoints of both potential capabilities and threats. Observations and recommendations are presented.

ADVANCES IN FULL MISSION ENVIRONMENT SIMULATION TECHNOLOGY

Fuss, Norbert, CAE Electronics G.m.b.H., Germany; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 2; 8p; In English; See also 19980016571; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

The significant advances in the field of simulation technology allow a more and more realistic reproduction of a weapon system's tactical environment. On the other hand, modern weapon systems place increasingly high demands on the quality and complexity of training equipment. In particular, such weapon system can no longer be regarded as autonomous, individual components. Rather, they have become an element of a complex military structure fulfilling operation-specific tasks. This leads to the conclusion that the design of training equipment should not only be system-specific but also operations-specific. The technologies which have been developed over the last years, especially in the fields of tactical simulation, computer-generated forces (CGFs) and networking, now enable the flexibility which is mandatory for structuring such a training system. The technological basis required for creating such a system will be discussed in this paper on the example of a Complex Air-Warfare Demonstrator, which has been developed under a European study contract.

VIRTUAL ENVIRONMENTS: VISUALIZATION THROUGHOUT THE COMBAT MISSION

Adagio, Floyd, Cambridge Research Associates, USA; Babiak, Nicholas, Cambridge Research Associates, USA; Bollinger, Kenneth, Defense Micro-Electronic Activity, USA; Caposell, Charles, Naval Air Systems Command, USA; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 2; 6p; In English; See also 19980016571; Original contains color illustrations; Copyright Waived; Avail: CASI; A02, Hardcopy; A02, Microfiche

All levels of the military command structure, from senior military commanders to the forward combatant require visualization of data and fusion of tactical and strategic information. Specifically, visually oriented displays provide intuitive, readily understandable information that can be easily interpreted and acted upon. Visual systems provide a variety of data and information including maps, terrain elevation, imagery, iconics, symbology, and text. The effective use of military information in a combat situation should be specific to the individual mission, yet be consistent with all other levels of the military command structure. Consistency among and between command levels is critical to support coordinated planning, execution, and after-action activities.

This manuscript and associated presentation provide a discussion of the application of virtual visualization environments within a hierarchical requirements structure, based on warfighting functional requirements. Additionally, this presentation relates functional requirements to system characteristics and discusses utility of the information to airborne applications.

SOME THOUGHTS ON THE MILITARY MISSIONS AND OPERATIONAL SCENARIOS REGARDING HYPERSONIC VEHICLES
QUELQUES REFLEXIONS SUR LES MISSIONS MILITAIRES ET LES SCENARIOS OPERATIONNELS RELATIFS AUX VEHICULES HYPERSONIQUES

Cazin, Ph., Office National d'Etudes et de Recherches Aérospatiales, France; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 3; 12p; Summary translated by Schreiber; In French; See also 19980018672; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

The article looks into powered flight in the atmosphere at hypersonic speed for certain military uses, such as: (1) long-range ground or surface attack missiles, where high speed improves the defense penetration capacities; (2) reconnaissance and surveillance drones; (3) very fast air-to-air missiles, capable of intercepting either ballistic missiles during the accelerated phase or airborne targets of great value at long range; (4) long-range ground or surface/air defense systems; and (5) faster and more flexible access to space, particularly during times of crisis.

The USA Air Force is currently going through a planning process to structure itself for the 21st Century. There have been several studies on this subject such as "Joint Vision 2010" that discuss mission requirements and the Air Force Scientific Advisory Board's "New World Vistas" that discuss relevant technology issues for the future. Figure 1 shows the six core competencies that the Air Force will maintain into the 21st Century. These core competencies will focus the Air Force mission areas and shorten the lines of communication between the user and the acquisition/research community through a new concept for the Air Force called Battle Labs. Purpose of the Battle Labs is to provide for the rapid assessment of technology on operational requirements under realistic conditions. This paper provides an update to these initiatives and provides the reader with an overview of the current Air Force Modernization Planning Process (AFMPP) and how it is effecting the Air Force Science and Technology Plans into the next millennium. This paper highlights several technology thrusts that will have an impact on air operations in the next Century.

FUTURE COMBAT AIRCRAFT DEVELOPMENT IN EUROPE

Bridel, G., Daimler-Benz Aerospace A.G., Germany; Ross, H. G., Daimler-Benz Aerospace A.G., Germany; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 1; 12p; In English; See also 19980033517; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

Within the last decade three new combat aircraft have been developed in parallel in Europe: The Eurofighter, the Rafale and the Gripen. This happened probably for the last time. New scenarios and missions, but in particular reduced defence budgets, the growing integration into a European Union and strong competition on the Euro-

pean and world market, in particular from the US and Russia, will eventually force (1) European nations to formulate common requirements; (2) the national Governments to coordinate their research and development efforts; (3) the airforces to coordinate their training, operation and maintenance activities; and (4) the national industries to form a common European military aircraft company, if a truly competitive military aircraft development and production capability in Europe is to be maintained.

COST BENEFITS IN THE ACQUISITION OF A UTILITY TACTICAL TRANSPORT HELICOPTER FLEET FOR THE CANADIAN FORCES

Caux, L. A., National Defence Headquarters, Canada; Delaney, R. G., National Defence Headquarters, Canada; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 1; 10p; In English; See also 19980033517; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The requirement for a Utility Tactical Transport Helicopter (UTTH) fleet is derived from the roles of the Canadian Forces and the specific missions assigned to the Land and Air Forces. In general, UTTH resources can be called upon to conduct operations in any of the following general mission areas: (a) Operational and training support to the land forces and other CF organizations; (b) International peacekeeping operations; and (c) Operations in aid of the civil authority.

NATO ALLIANCE GROUND SURVEILLANCE INTEROPERABILITY

Lenk, Peter J., North Atlantic Treaty Organization, Netherlands; Retzer, Gert, North Atlantic Treaty Organization, Netherlands; Apr. 1998; 8p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Through the NATO Alliance Ground Surveillance (AGS) Project, NATO is proposing to procure an airborne ground surveillance system based on a NATO-owned and operated core capability which would be supplemented by interoperable national assets, as required. The NATO Consultation, Command and Control (C3) Agency (NC3A), together with support from six nations, France, Germany, Italy, Norway, The UK and The USA, has established a testbed capability which includes simulations of the candidate sensor systems and various exploitation capabilities. This testbed, coupled with various other command and control testbeds resident at NC3A, allows the study of many aspects of command and control associated with the AGS problem. Essential to the selected ownership option is the concept of the interoperability of the NATO-owned assets with each other and with the nationally-owned assets. In order to address this problem, the NC3A, in conjunction with the six nations has developed an architecture and a standard format for the sensor data, so that any ground station could be made to receive and process data from any of the candidate platforms. Important to the solution is the ability to simultaneously receive and process data from different sensors and sensor platforms allowing for the fusion of data and potentially leading to improved surveillance coverage, tracking performance and accuracy. This approach has been prototyped and tested in the laboratory utilizing the AGS testbed. Recently, a large experiment was conducted during which several real AGS platforms and ground stations were utilized in order to prove the interoperability concepts that have been developed at NC3A in a more practical environment. In order to set the stage, the paper begins with a brief overview of the NATO AGS project followed by a definition of the interoperability problem. Next, the hardware and data architecture developed at NC3A for achieving interoperability is described. Finally, the paper concludes with a description of a recent AGS interoperability experiment used to prove the concepts is presented.

FROM MANNED TO UNMANNED: A VIABLE ALTERNATIVE TO THE SCRAPYARD

Gatti, A., Alenia Spazio S.p.A., Italy; System Design Considerations for Unmanned Tactical Aircraft (UTA); Jul. 1998; 10p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Analyzing the different scenarios currently considered by NATO (Peace keeping, Out of Area, Counter Proliferation, Article 5) requirements of weapon systems at the same time precise, lethal, with a great stand-off range and endurance capability emerge. Budget, humanitarian and political needs together with improvements in technology suggest that un-habitated systems will become the best answer to those requirements. The Italian Air Force still operate a large number of F-104s that within a few years will be phased out. The conversion of F-104s into autonomous and recoverable unmanned vehicles able to perform ground attack or SEAD missions, or into a high-altitude reconnaissance platform is feasible and seems an attractive and affordable way to develop an effective hardware able to safely operate in mixed air operations in which manned and unmanned planes share different roles.

THE ROLE OF UNMANNED TACTICAL AIRCRAFT IN THE BATTLEFIELD SURVEILLANCE

Thevenot, Regis, Aerospatiale, France; dAudiffret, Antoine, Aerospatiale, France; Jul. 1998; 8p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper deals with the role of Unmanned Tactical Aircraft (UTA) in tactical surveillance and support missions on a battlefield. It addresses the main following points: (1) A definition of what are the "UTA" addressed in this paper; (2) An overview of the new battlefields and their influence in the surveillance and reconnaissance missions and architectures; (3) A presentation of the environment where the UTA have to fly - atmospheric constraints, operational constraints, enemy constraints; (4) A description of the various missions which could be performed. In particular, for reconnaissance and surveillance missions, some examples extracted from STANAG 3769 will be given and will demonstrate the ability of some classes of UTAs and sensors to perform some specific missions; and (5) An overview of some UTA proposed by Aerospatiale and some other companies with their main characteristics. This part will be focused on existing systems such as CL 289 (deployed in Bosnia), Medium Altitude vehicles and High Altitude Long Endurance concepts. The paper will end with the description of some Concepts of Operations for UTA systems on a Battlefield.

THE OPERATIONAL EFFECTIVENESS OF UCAVS IN MOBILE TARGET ATTACK

Stewart, B. D., Defence Evaluation Research Agency, UK; Jul. 1998; 6p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper addresses a high-level approach to the analysis of uninhabited combat air vehicle (UCAV) effectiveness. The need for effectiveness analysis to take place in a range of realistic operational contexts is established, and the utility of effectiveness analysis is addressed. It is argued that it is necessary to take a 'system of systems' view in assessing UCAV effectiveness due to the diversity of impacts such systems will have on military operations. Relationships between some areas of UCAV performance, and their impacts on UCAV effectiveness, are presented as examples of the complexity of UCAV operations and to demonstrate the need for effectiveness analysis to assist in system definition.

CONOPS OF HALE UTA IN AN INFRARED EARLY WARNING MISSION FOR THEATER MISSILES DEFENSE

Gilbert, Herve, Aerospatiale, France; Thevenot, Regis, Aerospatiale, France; Jul. 1998; 8p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper presents the concept of High Altitude Long Endurance UTA equipped with Infrared sensors for Tactical Ballistic Missiles (TBM) detection and tracking. After a short presentation of the general context of operations in an Anti Tactical Ballistic Missile (ATBM) defense system, the IR HALE concept is depicted in its technical aspects as well as in its operational aspects: (1) analysis of potential "observable features" (signatures) of missiles, and crossing with general ATBM defense needs leading to introduce the IR HALE concept; (2) analysis of its potential performance levels in two major observation functions (missiles detection and tracking), derivation of a preliminary design; (3) exploration of major operational features (survivability,...); (4) synthesis of these elements: analysis of defense capabilities in typical TBM "Out of Area" scenery, potential roles inside global ATBM defense Systems, for Early Warning, and Weapon Systems commitment; (5) description of the command and control segment of such a system and its integration into air operations; and (6) brief overview of the other missions that can be envisioned for such a UTA. Concluding remarks highlight the position of the IR HALE UTA concept among other Early Warning / Cueing systems, both in terms of technical performance and military concept of employment.

JOINT SEMI-AUTONOMOUS AIR WEAPON SYSTEM

Schwartz, R. W., Naval Air Warfare Center, USA; Millett, S. B., Naval Air Warfare Center, USA; Rogers, F. T., Naval Air Warfare Center, USA; Hedman, B., Naval Air Warfare Center, USA; Jul. 1998; 10p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The Naval Air Warfare Center has investigated the idea of a semi-autonomous air weapon system that could be used in a lethal role. While such a system appears to be a natural continuation of military aviation we are just now beginning to appreciate some of the nuances inherent in such a system. In our approach we will not just "put weapons on UAV" or "take the pilot out of cockpit" either physically or mentally, or produce "more capable one-time use weapons". Rather our proposal for Joint Semi-Autonomous Air Weapon System (JSAAWS) is for a total weapon system designed for the tasks at hand. There are two lessons to be learned from history. The first lesson is that a new weapon concept such as JSAAWS must be designed for its intended application and not be just a retrofit of an existing system. The second lesson is that we need to develop JSAAWS in an orderly fashion, we need to walk before we run. Potential advantages of a JSAAWS for a Naval Expeditionary Force include increased survivability, decreased cost, increased lethality, via increased OPTEMPO and the ability of a JSAAWS to act as a force multiplier, and the ability to show a more aggressive presence when first-on-the-scene. In whatever role it plays, JSAAWS must be cost effective when compared to manned aircraft and one time use 'smart' weapons. One major contributor to cost savings would be greatly decreased operations and support costs due to vastly decreased flying hours. For example, life cycle cost could be reduced by 28% just from reduced flight hours. We have looked at several missions for a JSAAWS, some of which are more suitable for a JSAAWS than others. These are: SEAD (the initial mission of choice for the operational community), Battlefield Support/Simplification, Armed Recce, ASuW in the Littoral, supporting Operational Maneuver ... from the Sea, Counter Cruise Missiles, Offensive Counter Air, and Defensive Counter Air. Three notional system design concepts have been defined that cover all of the missions for a Naval Expeditionary Force. The high-end concept is the Highly Maneuverable Lethal Vehicle, which will be described in detail in paper 4 of this Conference. This would be a multi-role system for both air-to-air and air-to-surface missions. The air arsenal ship is a concept that has been put forward by the US Air Force. It would have limited air-to-air and air-

to-surface roles. The low-end concept would have capability in a limited, but operationally significant, set of air-to-surface missions, CAS, BAI, AI, SEAD, Indirect Fires. Included in this mission set is a significant percentage of the total targets for tactical combat aircraft.

OPERATIONAL CONCEPTS FOR UNINHABITED TACTICAL AIRCRAFT

Deets, Dwain A., NASA Dryden Flight Research Center, USA; Purifoy, Dana, NASA Dryden Flight Research Center, USA; Jul. 1998; 4p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

This paper describes experiences with five remotely piloted flight research vehicle projects in the developmental flight test phase. These projects include the Pathfinder, Perseus B, Altus, and X-36 aircraft and the Highly Maneuverable Aircraft Technology (HiMAT). Each of these flight projects was flown at the NASA Dryden Flight Research Center. With the exception of the HiMAT, these projects are a part of the Flight Research Base Research and Technology (R&T) Program of the NASA Aeronautics and Space Transportation Technology Enterprise. Particularly with respect to operational interfaces between the ground-based pilot or operator, this paper draws from those experiences, then provides some rationale for extending the lessons learned during developmental flight research to the possible situations involved in the developmental flights proceeding deployed uninhabited tactical aircraft (UTA) operations. Two types of UTA control approaches are considered: autonomous and remotely piloted. In each of these cases, some level of human operator or pilot control blending is recommended. Additionally, "best practices" acquired over years of piloted aircraft experience are drawn from and presented as they apply to operational UTA.

THE CHALLENGE OF UAV SUPPORTING OFFENSIVE AIR OPERATIONS

Frampton, R. A., Defence Evaluation Research Agency, UK; Jul. 1998; 6p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper provides an overview of some of the challenges facing the use of UAV in combat roles. Offensive roles are identified and the suitability of UAV for these discussed. The use of UAV for surveillance, target acquisition and reconnaissance is acknowledged as well established, the roles involving weapon delivery are less defined. The limitations on using UAV in combat roles are not seen dominantly as technical but more operational. The need to define the concept of operations for using UAV in combat is considered vital. Simulation is advocated to establish the viability of combat UAV concepts, conduct performance trade-off studies and to develop appropriate partitioning of control and decision making. Manned and un-manned platforms are seen as being complementary for the foreseeable future with UAV freeing up the manned platforms enabling them to undertake the roles needing flexibility. The major challenge is seen as establishing an environment in which both manned and un-manned platforms can work together effectively and safely.

MISSION RE-PLANNING FOR STANDOFF WEAPONS

Henne, Marlow, Sverdrup Technology, Inc., USA; Baker, James H., Air Force Development Test Center, USA; Jul. 1998; 12p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

This paper frames a general discussion of current air campaign planning methods at the campaign and mission command echelons,

and discusses the operational and technical mission re-planning requirements required for standoff weapons to engage fleeting targets or targets discovered immediately before or during a weapons delivery mission. Some weapon systems already have the technology needed to engage this threat; doctrinal advances and allocation of scarce sensor and weapons resources are the driving factors preventing effective fleeting target engagement.

UNMANNED TACTICAL AIR VEHICLES: AN ELECTRONIC COMBAT PERSPECTIVE

Langham, S. J., Defence Evaluation Research Agency, UK; Zanker, P. M., Defence Evaluation Research Agency, UK; Jul. 1998; 10p; In English; See also 19990007836; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This discussion paper, arising from project work at UK DERA, considers UTAVs from an electronic combat perspective. The paper will focus firstly upon their application to Electronic Combat roles, and secondly upon the problems of UTAV self protection by means of Defensive Aids Subsystems (DASS). UTAVs will find a variety of roles in the military operations of the future, both in conflict, and in operations other than war, such as peace-keeping and humanitarian aid. This paper identifies in general the various roles and scenarios which may become applicable to UTAVs. Current UTAVs are predominantly used for reconnaissance, however their near-term role is expanding to encompass communications relay, electronic warfare, environmental monitoring, target designation and the suppression of enemy air defences (SEAD) applications. The paper addresses the SEAD scenario, sensor payloads, airframe performance requirements and levels of threat faced. The SEAD role presents a particularly high risk for airframe survivability, as the UTAV is challenging the very threats which may be used against it. Such UTAVs are likely to carry advanced payloads, making for a high-value vehicle, requiring some measure of self-protection. Defensive aids will therefore feature in UTAV system designs. It is important to match the style of defensive aids to the roles and concepts of operation of the various types of vehicle envisaged. The style of self protection may be biased towards threat avoidance, confusion of air defences, or towards the countering of immediate threats. The paper discusses these styles of defensive aids systems, their cost and system drivers, and the types of components needed to realize them. The defensive aids suites could in most cases have to operate without manual intervention, and in this respect will be rather different to the traditional systems found in manned aircraft. The paper discusses these differences, and their implications in terms of system cost, complexity and effectiveness. The style of any countermeasure responses proposed for UTAVs may vary considerably according to the type of operation and the rules of engagement. Consideration must be given to the dangers of collateral damage, and even environmental damage, in certain circumstances. The paper discusses these considerations.

THE INTERNATIONAL TEST AND TRAINING "RANGE"

VanNorman, C., Advisory Group for Aerospace Research and Development, France; Aerospace 2020; Sep. 1997; Volume 3, 48-52; In English; See also 19990014353; Copyright Waived; Avail: CASI; A01, Hardcopy; A02, Microfiche

This paper describes the test range of the year 2020 and its anticipated capabilities. It also describes technological and organization changes that are key to realizing this envisioned future test range. The discussion validates the need for a common development/test/training environment and points to the difficulties in establishing it. Although it might be desirable to locate all of this activity at a single place, such a concept would be prohibitive from both a fiscal and political standpoint. Thus, virtual integration of multiple, international facilities, laboratories, test ranges, simulated environments will be required to determine the weapons full capabilities for each mission scenario. This international integration must be carried out given the current fiscal

67 THEORETICAL MATHEMATICS

and geopolitical environment, while maintaining member nation security interests. The test and training "range" of the year 2020 will be a virtual not a physical place.

COMMANDERS' DECISION AID FOR BATTLE PLANNING AND EXECUTION

vandenBroek, P., Advisory Group for Aerospace Research and Development, France; Aerospace 2020; Sep. 1997; Volume 3, 79-82; In English; See also 19990014353; Copyright Waived; Avail: CASI; A01, Hardcopy; A02, Microfiche

Powerful computing equipment will enable the prediction of the evolution of a complex process such as a battle mission, and much faster than real time. This will be used to evaluate the effects of changes in battle plans, both changes in battle tactics and changes in allocated assets. Information networks, mission simulation and virtual reality technology will relieve the commander from much work by the presentation of any desired type of information in any quantity to the commander, but it should be kept in mind that all the decisions remain the full responsibility of the commander himself. The system, however sophisticated, has to provide all the possibilities to live up to this responsibility.

Fuzzy set theory was introduced 30 years ago by L.A. Zadeh, with the purpose of formalizing the representation and management of imprecise or approximate knowledge, in order to facilitate the management of very complex systems, for instance systems involving human components. It provides tools to process imperfect information. In this paper, we introduce the basic elements of fuzzy set theory: definition of fuzzy sets; various operations of fuzzy sets; fuzzy relations; fuzzy arithmetics. We present possibility theory which allows to manage non-probabilistic uncertainty and leads to a form of reasoning on imperfect knowledge when used in synergy with fuzzy set theory. We present the bases of this approximate reasoning and we show how it can be used in inferences or in control.

ACOUSTICS

19960003593 Tsentrlni Aerogidrodinamicheskii Inst., Aerodynamics Div., Moscow, USSR

EXTERNAL NOISE OF SINGLE ROTOR HELICOPTERS

Samokhin, V. F., Tsentrlni Aerogidrodinamicheskii Inst., USSR; Rozhdestvensky, M. G., Mil Moscow Helicopter Plant, Russia; AGARD, Aerodynamics and Aeroacoustics of Rotorcraft; Aug 1, 1995, 8 p; In English; See also 19960003572; Copyright; Avail: CASI; A02, Hardcopy; A04, Microfiche

Intensity, acoustical radiation spectrum, as well as single-rotor external noise level are analyzed in the paper based on the experimental data obtained from testing actual helicopters. The helicopter acoustical far-field is shown to be a superposition of the main and tail rotor fields. The external noise spectrum measured on the ground

contains discrete and broadband components. Discrete component frequencies are multiples of the main and tail rotor passage frequencies and fall within the frequency ranges 20-160 Hz and 100-500 Hz respectively. Continuous spectrum radiation can be seen within the whole sound frequency range, but the maximum intensity is registered at 500-3,000 Hz frequencies. It has been found that the intensity of the helicopter acoustical radiation in the direction corresponding to the maximum external noise level and the power required by the main and tail rotors change according to the same law. The helicopter acoustical field is asymmetric relative to the vertical plane running through the longitudinal axis of the aircraft. The helicopter external noise level measured in PNdb has been found to be defined by the tail rotor acoustical radiation with a discrete frequency spectrum within 100-500 Hz and the continuous spectrum radiation within 500-3,000 Hz. The tail rotor configuration is shown to affect the helicopter acoustic response. Experimental studies of the external noise produced by the same helicopter first equipped with a tail rotor with symmetrical layout of the blades and then with an X-shaped tail rotor have allowed to establish that its tail rotor is the dominating source of the helicopter broadband noise. The X-shaped tail rotor has allowed to reduce the helicopter noise by 3-5 PNdb in level flight.

Within a four nation research project jointly conducted by AFDD, NASA, ONERA, DLR and DNW the HHC effects on BVI noise and vibrations were investigated. The project had the objective to gain a physical understanding of the involved mechanisms and comprised theoretical as well as experimental studies. The latter ones were performed in the German Dutch Wind Tunnel (DNW) and had the overall goal to provide information about all relevant parameters. For that purpose, different measurement techniques like laser light sheet, laser doppler velocimetry as well as acoustic and non-intrusive blade deflection measurements were applied to a highly instrumented hingeless model rotor. All of these techniques were employed at different rotor conditions for different HHC settings, thus yielding a very comprehensive data base. It gives a physical insight in the mechanisms involved in BVI noise and vibration reduction by higher harmonic control and forms the basis for an improved understanding and modeling of these complex phenomena.

CALCULATION OF HIGH-SPEED NOISE FROM HELICOPTER ROTOR USING DIFFERENT DESCRIPTIONS OF QUADRUPOLE SOURCE

Ianniello, S., Italian Aerospace Research Center, Italy; Debernardis, E., Italian Aerospace Research Center, Italy; AGARD, Aerodynamics and Aeroacoustics of Rotorcraft; Aug 1, 1995, 7 p; In English; See also 19960003572; Copyright; Avail: CASI; A02, Hardcopy; A04, Microfiche

The problem of quadrupole noise prediction is addressed and treated through the acoustic analogy approach, comparing different solution forms for the FW-H equation including the nonlinear source term. In particular, results obtained using the volume integration of the quadrupole source are presented. A comparison is established with results from a set of acoustic Euler calculations; a comparative analysis of the computing time is conducted, and methods to reduce the computational effort requested by the volume integration are proposed. Then, a particular description of quadrupole source term is introduced, giving rise to some surface integrals. Their role is investigated in order to assess how they affect the quadrupole noise calculation.

AEROACOUSTIC CALCULATION OF HELICOPTER ROTORS AT DLR

Schultz, K.-J., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Lohmann, D., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Lieser, J. A., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Pahlke, K. D., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; AGARD, Aerodynamics and Aeroacoustics of Rotorcraft; Aug 1, 1995, 19 p; In English; See also 19960003572; Copyright; Avail: CASI; A03, Hardcopy; A04, Microfiche

The rotor noise level is one of the main design parameters for future rotorcrafts. This fact requires accurate aeroacoustic prediction tools. The two most annoying contributors to rotor noise radiation are blade vortex interaction impulsive noise (BVI) and highspeed compressibility impulsive noise (HI). At DLR great effort is concentrated on the two impulsive noise phenomena. The paper presents examples of (1) the prediction of lowspeed BVI impulsive noise using aerodynamic input from a quasisteady formulation of the panel method LBS and the linear terms of the FWH-equation for acoustic calculation, and (2) the prediction of highspeed hover and forward flight impulsive noise using transonic aerodynamic input from a 3D-EULER code and the FWH-equation including the nonlinear quadrupole term for the acoustic calculation. The calculated results are compared with experimental data from the AH-1/OLS (UH-1H) model tests in DNW, 1982, and from the HELINOISE test (BO 105 model in DNW). The prediction of lowspeed BVI noise is highly dependent on the used wake model for the blade pressure calculation, while the acoustic calculation is quite straight forward. The comparison of experimental data with calculated acoustic results using blade pressure input from the LBS code in connection with Beddoes wake model shows satisfactory agreement. In the highspeed case the perturbation velocity field solution of the EULER code provides the input for the quadrupole volume integral in the FWH-equation. Four different solutions to solve the quadrupole term are presented for the hover case: volume integration, two kinds of pre-integration in blade normal direction and an approximation using the blade surface values. In comparison with experimental data the different calculated results for the hover case shows that the expensive volume integration provides the best solution, but the approximated approaches are also satisfactory. For the highspeed forward flight case the quadrupole approach with pre-integration has been selected and quite successfully applied.

This paper investigates the methods used for rotor rotational noise, impulsive noise from blade/vortex interaction, high speed noise, rotor broadband noise, the various types of fenestron noise, and noise from the turboshaft engines. From the helicopter manufacturer's standpoint i.e. with respect to the prediction capability of the full chain of codes, including unsteady airloads calculation, an analysis of strengths and deficiencies is made and illustrated with experimental correlations. From this point of view, the fenestron is hovering flight and the rotational noise of rotors are both satisfactorily predicted, but in the event of interactions, the load calculation does not offer the full desired accuracy. Research regarding high speed noise is in progress and the research on broadband noise must be resumed. As regards turboengines, there is no alternative to the experimental approach for the helicopter manufacturer.

THE USE OF KIRCHHOFF'S METHOD IN ROTORCRAFT AEROACOUSTICS

Lyrintzis, Anastasios S., Purdue Univ., USA; AGARD, Aerodynamics and Aeroacoustics of Rotorcraft; Aug 1, 1995, 16 p; In English; See also 19960003572; Sponsored by Minnesota Supercomputer Inst. and Cray Research, Inc.; Copyright; Avail: CASI; A03, Hardcopy; A04, Microfiche

A comprehensive review of the use of Kirchhoff's method in rotorcraft aeroacoustics is given. Kirchhoff's integral formulation allows radiating sound to be evaluated based on quantities on an arbitrary control surface S if the wave equation is assumed outside. The control surface S is assumed to include all the nonlinear flow effects and noise sources. Thus only surface integrals are needed for the calculation of the far-field sound. A numerical CFD method can be used for the evaluation of the flow-field solution in the near-field and thus on surface S. Kirchhoff's integral formulation has been extended to an arbitrary, moving, deformable piecewise-continuous surface. The available Kirchhoff formulations are reviewed and various rotorcraft aeroacoustic applications are given. The relative merits of Kirchhoff's method are also discussed.

NOISE ASSOCIATED TO ROCKET ENGINE TESTING AND NOISE REDUCTION MEASURE TAKEN ON DASA'S TEST FACILITIES IN OTTOBRUNN

Spagna, P., Deutsche Aerospace A.G., Germany; Schorer, E., Mueller-BBM G.m.b.H., Germany; AGARD, Environmental Aspects of Rocket and Gun Propulsion; Feb 1, 1995, 15 p; In English; See also 19960008937; Copyright; Avail: CASI; A03, Hardcopy; A03, Microfiche

The presented paper explains the environmental implications of noise resulting from rocket testing by means of an evaluation performed within the scope of the development tests of cryogenic liquid propellant engine components foreseen for the Ariane V launcher. An analysis of the different noise sources is carried out and the measures taken to perform noise reduction are presented. Finally, an outlook over the noise reduction measures in preparation for the case of other engine components, presently in development at DASA, is also given.

The paper presents an overview of the acoustic design of the EUROCOPTER EC 135 helicopter. The layout of the different noise relevant components were supported by measurements on the test bench and in the wind tunnel. The experimental and theoretical investigations were accompanied by acoustic measurement on the BO 105 and the BO 108. The results are discussed with respect to neighbourhood noise emission and acoustic detectability aspects. The low noise design of the fan-in-fin tail rotor (FENESTRON(R)) and the positive effect on the improved noise signature of the EC 135 is presented and compared to BO 105 and BO 108 with a conventional tail rotor. The main rotor of the EC 135 shows a reduced noise signature especially at higher Mach number due to the reduced blade thickness at the tip region, the introduction of a new airfoil generation, and an advanced blade shape. The low noise concept of the EC 135 is proved by noise measurements with ground based microphones.

The scientific community has experienced substantial growth in knowledge and in the understanding of human auditory localization, particularly in recent decades. This background has spawned the concept of 3-dimensional (3-D) sound and has demonstrated that audio cues can be created and presented over headphones that indicate the location of sounds around the listener. This concept has been incorporated in prototype and commercial systems that synthetically create this virtual or 3-dimensional audio display. Spatial auditory information via 3-D audio displays, has demonstrated significant enhancements in target detection and acquisition, threat avoidance, voice communications enhancement, and situational awareness in laboratory investigations, simulators, and flight demonstrations. Numerous applications in both military and civilian arenas have been identified, and many demonstrated. Although significant enhancements have been obtained, ongoing work is required in the areas of display resolution, head related transfer functions with an emphasis on elevation cues, spatial auditory symbology, distance cues, and sensory interactions involving audio/visual and audio/visual/vestibular systems. Research and development will continue to enhance the understanding and performance of 3-D audio displays. Applications of this spatial auditory information technology will continue to expand in all areas providing even greater increases in user performance and safety.

The accurate prediction of the sound field generated by movement in water bodies is important to control sources and reducing noise. Measurement and processing of hydrodynamic noise can give important information about the structure of flow around a body. One important feature of high speed flows around bodies is the presence of cavitation. An accurate simulation of the flow field past cavitation body is the first requisite in the computation of the radiated noise. The available models of flows that describe the cavitation flows do not give an adequate picture of the flow in all domains. So the data on noise in cavitation flows are based on experimental measurement. Some such experiments are discussed in the article. The estimation of acoustic

efficiency of different kinds of flows is presented. Analysis of experimental data provides an estimation of Strouhal numbers in flows with different cavitation number.

An optical double pass retroreflection surface inspection technique (D Sight) used for visualizing surface distortions, depressions or protrusions has been adapted as a rapid, enhanced visual inspection method inspection of large external aircraft surfaces. A project to fully characterize the D Sight indications of corrosion damage in lap splices is currently active. Over 150 large transport aircraft fuselage lap splice specimens have been collected. D Sight Aircraft Inspection System - (DAIS) 250C has been developed and tested both in the laboratory and in the field. In laboratory tests lap splices retrieved from retired aircraft and subjected to accelerated corrosion and lap splices naturally corroded in-service were inspected with DAIS, eddy current, X-ray, shadow moire and subjected to tear down. It has been shown that the DAIS 250C is capable of locating corrosion pilloowing indicative of a thickness loss as low as 2 percent. The first field trial of the DAIS 250C was based on two service bulletins requiring inspection of longitudinal and circumferential lap splices on the 737-200 aircraft from BS 259.5 to BS 1016. The DAIS 250C inspection, including analysis and report, took 36 man-hours. The recommended technique in the SB was close visual inspection and the time required according to the service bulletins, was 278 man-hours.

OPTIMAL INFRARED DETECTOR CONFIGURATIONS FOR AIR TARGET DETECTION

Uda, G., Officine Galileo S.p.A., Italy; Barani, G., Officine Galileo S.p.A., Italy; AGARD, Guidance and Control for Future Air-Defence Systems; Jan 1, 1995, 10 p; In English; See also 19950025702; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

The airtarget detection by a thermal camera is a typical problem of 'hot spot detection' and the knowledge of the available energy on the infrared sensor becomes a critical item to analyse. In order to evaluate the performances of an infrared system in search and track threat warning or passive surveillance, it is necessary to compute the Signal to Noise Ratio (SNR) of the system. The maximization of the SNR is an important goal to assure long detection ranges against stealth threats or cruise missiles with very low emissivities. The large number of detectors is just one of the requirements for this kind of application and some energetic considerations lead up to consider particular geometrical array configurations. Usually, in the SNR evaluation it is assumed that all the energy from a target is focused by the optical system on a single detector element of the array. However, the image of a point source on the focal plane has a finite extent (spot) and its energy distribution is given by the Point Spread Function (PSF) of the optics. The interaction of the finite spot size with the array gives rise to a spreading of the energy impinging on the individual detectors, which causes a decrease of performances. In this paper a statistical evaluation of the loss of energy impinging on the detector due to the finite image size of point targets was performed through a Monte Carlo simulation, by considering the maximum of the energy integrated by

a single detector, it is possible to compute the effective SNR of the system. A new figure of merit, called Spreading Factor (SF), defined as the ratio between the maximum of the energy integrated by the single detector of the array and the total energy subtended by the PSF, permits to evaluate the capability of a detector array to detect point sources. Some typical detector and system configurations with their technological impacts have been examined.

Absorption of high peak power microwaves by water droplets can induce a spatially inhomogeneous temperature rise inside the droplet, thereby affecting the droplet evaporation rate and surface tension. A minute decrease of the droplet radius and small amounts of shape distortion can be readily detected by analyzing the changes in the nonlinear optical emission from perturbed droplets. In the visible wavelength region, a micrometer-sized droplet acts as an optical cavity that provides high-Q optical feedback for the nonlinearly generated radiation, such as lasing. Cavity resonances occur at discrete wavelengths that are commensurate with the integer number of wavelengths that can fit into the droplet perimeter. Intense nonlinear emission occurs whenever the round-trip gain is larger than the round-trip leakage from the droplet rim. A decrease of the droplet radius for example, associated with an increased evaporation rate, will cause all the nonlinear emission peaks to shift to shorter wavelengths. A shape distortion will cause the wavelengths of the nonlinear emission to vary along the droplet rim because the perimeters of the great ellipses change along the rim. Examples will be presented as to how spectral changes in the nonlinear emission can be used as a sensitive diagnostic probe of the size changes and shape distortions of flowing micrometer droplets.

The suggested subject relates to the experience gained by the Aerospatiale establishment of Cannes in the field of optical payloads integration. Within the framework of the activities relating to the space observation, important investments were carried out in Cannes with the aim being the ability to integrate optical instruments of very high performances. The objective of this communication suggested within the framework of symposium AGARD 1994 is to present the innovations which were necessary to ensure the integration and performances control of the high resolution optical payload, as well as the

methods that are developed for the ground testing facilities. We will not treat the intrinsic characteristics of this optical instrument nor of its mission.

During the MAPTIP (Marine Aerosol Properties and Thermal Imager Performance) experiment series in Dutch coastal waters in October 1993 shore-based polarized infrared images were recorded of air (fixed wing and helicopter) and sea targets in sea and air backgrounds, including a number of vertically and horizontally polarized image pairs of the Dutch oceanographic research vessel Hr Ms Tydeman. Complete characterization of the environmental conditions in the measurement area will be available through other MAPTIP participants. These images show no significant polarization features in ship images (less than 5%) or in sky background, but a considerable degree of vertical ('p') polarization in the sea background radiance at low emission (near grazing) angles, which is ascribed to surface emission polarization. This phenomenon for all observed times of day and sun positions, and more strongly in the LWIR than in the MWIR. A horizontal polarization filter provided 10 to 20% ship-to-sea contrast improvement due to suppression of sea background, and enhances horizon sea/sky contrast by up to 15%. These results are consistent with our previous measurements of polarization in the sun glint channel.

A FLIR CASE STUDY USING THE ELECTRO-OPTICAL TACTICAL DECISION AID (EOTDA) MARK 3

Mcgrath, Charles P., Naval Command, Control and Ocean Surveillance Center, USA; AGARD, Propagation Assessment in Coastal Environments; Feb 1, 1995, 8 p; In English; See also 19960007226; Copyright; Avail: CASI; A02, Hardcopy; A03, Microfiche

This report compares measured forward-looking infrared (FLIR) system detection ranges of a target ship, the Research Vessel Point Sur, with predictions from the Electro-Optical Tactical Decision Aid (EOTDA) version 3.0. The EOTDA was primarily developed by the Air Force, with only minimal attention applied to the complexities of the marine environment. The objective of this case study was to evaluate the infrared EOTDA performance for a target in an open ocean background. Surface meteorological and navigation data were recorded aboard the Point Sur. Eight FLIR missions were flown making 57 detection range measurements. The meteorological and navigation data were input to the EOTDA, and the prediction ranges were tabulated and compared with the reported FLIR data. Results showed reasonable accuracy during the clear-weather portion of the tests, but the EOTDA grossly overpredicted detection ranges when a stratus cloud ceiling prevailed. Attempts to determine integrated target temperature from thermistors mounted on the surface of the ship structure were unsuccessful. Since calibrated target and background temperatures were unavailable at the times of the FLIR detection range measurements, it was not possible to isolate the portion of the EOTDA most responsible for the overpredictions. However, the transmission model, LOWTRAN 7, has been thoroughly exercised and is well accepted. The target model (TCM2) of the EOTDA performed well in another case study during the same field tests. This would make the

water background model of the EOTDA most suspect. Further investigation of the water, sky, and cloud radiance models of the EOTDA is recommended, especially in the marine environment.

Ultra-fast intraband occupancy relaxation in semiconductor gain media has recently been shown to provide a wide band nonlinearity which is several orders of magnitude larger than the Kerr nonlinearity in silica fiber. We address recent work directed towards applications of nonlinearity to the wavelength conversion function in all optical networks; specifically, carrier wavelength spectral translation by four-wave mixing. In addition to reviewing the current performance of these devices including conversion efficiency, signal to noise, and a simple system demonstration, we will discuss the underlying physics of the ultra-fast four-wave mixing mechanism and its application to TeraHertz spectroscopy of intraband scattering. An overview of wavelength conversion in the context of all optical networks is provided and competing techniques to four-wave mixing wavelength conversion are also discussed.

SURFACE INTEGRAL METHOD TO QUANTIFY THE DROPLET NON-SPHERICITY EFFECT ON RAINBOW THERMOMETRY

vanBeeck, J. P. A. J., Von Karman Inst. for Fluid Dynamics, Belgium; Riethmuller, M. L., Von Karman Inst. for Fluid Dynamics, Belgium; May 1998, 8p; In English; See also 19980203985; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

A theoretical model is presented to compute the monochromatic rainbow interference pattern formed by ellipsoidal homogeneous, transparent particles. The model is applied to predict the effect of droplet nonsphericity on the errors in the particle temperature and size measurements, performed by rainbow thermometry. These results have been employed to achieve a quantitative validation of the experimental nonsphericity detection method, based on the comparison of different types of size measurements of the same droplet, derived from different interference structures that are visible in the rainbow pattern. As such, confidence can be established in the temperature measurement as far as the selected spherical droplets are concerned.

The review of optical methods, which were developed and used during the last years in TsAGI for investigations of aircraft aerodynamics and aeroelasticity, is presented. Non-traditional methods of flow investigations are considered in more detail: a raster-type shadowgraph method of flow visualization, laser interferometry with a narrow reference beam, shift interferometry and laser holographic interferometry, a laser-knife method. The combination of visualization by a laser-knife method with local measurements of velocity distribution with the help of a laser Doppler velocimeter (LDV) is offered, which allows to optimize a grid of nodes of velocity measurement. To study the shape, motion and deformation of the aerodynamic models and aircraft structure elements in aerodynamic wind tunnels a number of optical, laser and videogrammetric systems ensuring high sensitivity and processing of results in real time is developed.

RECORDING AND PROCESSING OF INTERFEROGRAMS BY SPECTRAL DESCRIPTION OF THE OPTICAL SEQUENCE

ENREGISTREMENT ET TRAITEMENT DES INTERFEROGRAMMES PAR CARACTERISATION SPECTRALE DE LA CHAÎNE OPTIQUE
Desse, J. M., Institut de Mecanique des Fluides de Lille, France; May 1998, 8p; In French; See also 19980203985; Original contains color illustrations; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The recording and processing of interferograms are greatly improved by the opportunity to be able to recreate in a microcomputer equipped with an image processing card the scale of experimental shadings of an interferometer equipped with a known white source and a given Wollaston prism. Considering the spectral characteristics of the light source and the three filters of the RVB video camera, one is able to express analytically the luminous strength of the interference fringes when the operating difference varies and to reproduce on the monitor the colors which are going to be displayed experimentally. Knowledge of the shading scale of the interferometer will allow one on the one hand to control in an optimal way the position of the prism during recording of the photographs, and on the other hand to process the interferograms automatically and with very high precision.

OPTICAL MEASUREMENTS OF SURFACE PRESSURE AND TEMPERATURE IN TURBOMACHINERY

Navarra, Kelly, Innovative Scientific Solutions, Inc., USA; Goss, Larry, Innovative Scientific Solutions, Inc., USA; Jordan, Jeffery, Innovative Scientific Solutions, Inc., USA; Rabe, Doug, Wright Lab., USA; Gord, Jim, Wright Lab., USA; Car, David, Wright Lab., USA; May 1998, 14p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

A new pressure-measurement technique which employs the tools of molecular spectroscopy has recently received considerable attention in the aerospace community. Measurements are made via oxygen-sensitive molecules attached to the surface of interest as a coating, or paint. The pressure-sensitive-paint (PSP) technique is now commonly used in stationary wind-tunnel tests; this paper presents extension of the technique to advanced turbomachinery applications. New pressure- and temperature-sensitive paints (TSPs) have been developed for application to a state-of-the-art transonic compressor where pressures up to 2 atm and surface temperatures to 140 C are expected for the first-stage rotor. PSP and TSP data images have been acquired from the suction surface of the first-stage rotor at 85% of the correct design speed for the compressor peak-efficiency condi-

tion. The shock structure is clearly visible in the pressure image, and visual comparison to the corresponding computer prediction shows quantitative pressures similar to the PSP data. The measurement error is estimated to range from 0.36 kPa in low pressure regions to 4 kPa in high-pressure regions. The errors were significantly increased by a failure mode of the camera which will be described.

OPTICAL INSTRUMENTATION FOR TEMPERATURE AND VELOCITY MEASUREMENTS IN RIG TURBINES

Ceyhan, I., Massachusetts Inst. of Tech., USA; dHoop, E. M., Massachusetts Inst. of Tech., USA; Guenette, G. R., Massachusetts Inst. of Tech., USA; Epstein, A. H., Massachusetts Inst. of Tech., USA; Bryanston-Cross, P. J., Warwick Univ., UK; May 1998; 10p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Non-intrusive optical measurement techniques have been examined in the context of developing robust instruments which can routinely yield data of engineering utility in high speed turbomachinery test rigs. The engineering requirements of such a measurement are presented. of particular interest were approaches that provide both velocity and state-variable information in order to be able to completely characterize transonic flowfields. Consideration of all of the requirements lead to the selection of particle image velocimetry (PIV) for the approach to velocity measurement while laser induced fluorescence of oxygen (O₂ LIF) appeared to offer the most promise for gas temperature measurement. A PIV system was developed and demonstrated on a transonic turbine stage in the MIT blowdown turbine facility. A comprehensive data set has been taken at one flow condition. Extensive calibration established the absolute accuracy of the velocity measurements to be 3-5 %. The O₂ LIF proved less successful. Although accurate for low speed flows, vibrational freezing of O₂ prevented useful measurements in the transonic, 300-600 K operating range of interest here.

OPTICAL BLADE VIBRATION MEASUREMENT AT MTU

Zielinski, M., Technische Univ., Germany; Ziller, G., Technische Univ., Germany; May 1998; 10p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Compressor rotor blade vibration measurements are crucial to the proper assessment of critical operating conditions and the prediction of blade life. Generally, at MTU these measurements are performed using strain gauges or the frequency-modulated grid system. In an attempt to provide an advanced alternative solution to the two standard techniques, MTU commenced work on an optical blade vibration measurement (OBM) system some years ago. For OBM, several optical trigger probes are installed in the compressor casing above the rotor, and the blade transit times between the probes are measured. An analysis of these transit times then provides information on blade vibrations. This paper describes the details of MTU's experimental OBM system and the analysis methods used. The capability of the system is demonstrated by means of various measurement tasks: vibrations excited by resonances with amplitudes as low as 10 micro-m(p) can be measured. Blade vibrations caused by compressor surges were analysed successfully. Comparative measurements show good agreement between OBM and strain gauge results. As an option the untwistness of the blades with increasing rotational speed can be measured.

NON-INTRUSIVE MEASUREMENT OF AN ENERGETIC MATERIAL REGRESSION RATE *MESURE NON-INTRUSIVE DE LA VITESSE DE REGRESSION D'UN MATERIAU ENERGETIQUE*

Cauty, Franck, Office National d'Etudes et de Recherches Aerospatiales, France; May 1998; 12p; In French; See also 19980206002; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

The non-intrusive method of an energetic material regression rate determination developed by ONERA is based on the ultrasound wave propagation time through the tested material. This direct, local and quasi-instantaneous method is aimed at determining the classical burning rate law of solid propellants in large pressure and initial temperature ranges. This technique demonstrates a good accuracy in various combustion regimes, specially in erosive burning, and for different solid propellants. Significant examples are presented in solid propellant domain. The application field of the ultrasound method extends to other materials for hybrid propulsion or thermal protective insulator degradation. The ONERA ultrasonic method and its associated electronic devices are operating either as an industrial procedure tool for solid propellant manufacturing or as a helpful diagnostic tool for research engineers.

DEVELOPMENTS IN HIGH ENERGY X-RAY RADIOGRAPHY OF RUNNING ENGINES

Allen, M. J., Rolls-Royce Ltd., UK; Rogers, J. D., Rolls-Royce Ltd., UK; May 1998; 8p; In English; See also 19980206002; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

There has been substantial industrial development of radiographic techniques for quantitative measurement of component and/or material clearances or movement within static or operating test pieces or machinery. Important examples of applications are in the fields of aeronautics, armaments, space sciences, and nuclear engineering. Following the demonstration and installation of a suitable high energy X-ray source for use with operating aero-engines, Rolls-Royce has been routinely carrying out high-energy X-ray radiography of engines on test beds since 1971. The current Rolls-Royce X-ray imaging equipment includes a film plate changer system, used for analysis of steady-state or slow transient events that enables sequences (up to 10 shots) of high-resolution film radiographs to be obtained at short (approx. 2 s) exposure times. A real-time X-ray video imaging system producing up to 25 frames/s is used for faster transients or where cyclic behavior is being investigated by strobing with the pulsed X-ray source. An Electronic Radiography imaging system, based on a cooled high-resolution CCD camera, has been developed to replace film radiography. This system enables long sequences (more than 100 images) of high resolution images to be obtained at fast data acquisition and transfer rates (up to 8 x 10⁶ (exp 6) pixel/s). Movements of regions of interest in sequences of images during an engine operating cycle are measured using cross correlation tracking software. The performance of a new Rolls-Royce imaging system for test bed use is discussed and the results of an X-ray test on an Adour engine are described.

ADVANCED ELECTRO OPTIC TARGETING SYSTEM

Jacobs, Richard W., Wright Lab., USA; Lapp, Henry S., Wright Lab., USA; Multi-Sensor Systems and Data Fusion for Telecommunications, Remote Sensing and Radar; Apr. 1998; 7p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

Future Aircraft targeting systems are integrating sensor inputs for automated target detection, location and identification with the goal to both lower system cost and increase system performance. This paper describes a common aperture electro optical (EO) targeting concept for an integrated air-to-ground EO targeting system using promising developments in multispectral target detection and in laser target iden-

77 THERMODYNAMICS AND STATISTICAL PHYSICS

tification. The integrated capability allows use of a minimum system aperture while increasing recognition and targeting ranges outside missile treat envelopes. The technical status and preliminary test results of the Wright Laboratory thrusts to develop both laser identification and thermal spectral detection capabilities will be discussed. These involve developments and demonstrations of multi-spectral detection using a few thermal bands and non-cooperative target identification using a burst illumination laser with eyesafe wavelength and a short wave infrared gated camera. These individual concepts will be mature enough to support an integration effort in the 1999/2000 time-frame. The cost, performance and level of automation supports use for both manned and unmanned air vehicle targeting and reconnaissance missions.

PIXELLESS INFRARED IMAGING USING QUANTUM WELLS

Brown, Gail J., Wright Lab., USA; Szmulowicz, Frank, Wright Lab., USA; Apr. 1998; 7p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

A new concept for designing infrared imaging systems is under development. In this concept, absorbed long wavelength infrared light is up-converted to near infrared emission through the vertical integration of a p-type multiple quantum well infrared photodetector (QWIP) heterostructure and a light emitting diode (LED). The infrared (IR) radiation is absorbed in the QWIP part of the heterostructure. The optically excited charge carriers from the QWIP are used to stimulate near IR emission from the LED layers. This emitted radiation can then be imaged using a commercial, high resolution silicon CCD camera. Because of the extremely short path that the photoexcited charge carrier traverses between the QWIP and LED layers, the emitted photon originates at the same spatial position as the absorbed photon, such that there is a one-to-one correspondence between the long wavelength infrared image and the near infrared image. With this device, the need for fabricating thousands of tiny pixels on the infrared array to generate a high resolution image is eliminated. With the elimination of pixels comes the elimination of the need for thousands of contacts to apply a bias voltage to each individual pixel. Only two wires are required to bias this QWIP and LED heterostructure. For a two color infrared system, this concept would require only three wires for the entire large area imaging array. Our preliminary results for a vertically integrated p-type GaAs/AlGaAs QWIP and LED heterostructure will be discussed.

AEROTHERMODYNAMICS OF RADIATION-COOLED SURFACES

Hirschel, E. H., Daimler-Benz Aerospace A.G., Germany; Aerothermodynamics and Propulsion Integration for Hypersonic Vehicles; Oct. 1996; 16p; In English; See also 19970009247; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

This lecture introduces to the aerothermodynamics of radiation-cooled surfaces of high-speed flight vehicles operating in the earth atmosphere at speeds below approximately 8 km/s. After a discussion of the technical background of heat loads at hypersonic flight, a simple analysis shows how the radiation-adiabatic temperature qualitatively depends on the local boundary-layer properties. Computed examples illustrate the findings and show the implications of radiation cooling for the vehicle design. Scaling laws and non-convex effects are treated,

and the influence of radiation cooling on several surface phenomena is considered. Finally, the need of a hot experimental technique is discussed and a possible integrated aerothermodynamic design approach is sketched.

CONFIGURATIONAL AEROTHERMODYNAMICS OF RAM AND SCRAM PROPELLED VEHICLES

Perrier, P., Dassault Aviation, France; Courty, J. C., Dassault Aviation, France; Aerothermodynamics and Propulsion Integration for Hypersonic Vehicles; Oct. 1996; 36p; In English; See also 19970009247; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Numerical and experimental tools are available for effective design of RAM and SCRAM propelled vehicles. Taking into consideration that flight conditions are not well duplicated in wind tunnel tests for high entropy flow, performance prediction should be supported by both calculations and experiments. An efficient multidisciplinary approach should account for all constraints placed by aerothermal and aerodynamic factors.

This lecture provides a general review of aerothermodynamics and propulsion integration of supersonic and hypersonic missiles. We focus on the major design problems and the simulation means with their potentials and deficits. Considered design problems are external aerothermodynamics, including the specific problem of lateral jet control, and the ramjet/scramjet propulsion integration. Simulation means cover Computational Fluid Dynamics (CFD) tools as well as ground test facilities. The last part of the lecture illustrates the feasibility to use CFD tools in the design process as a complementary approach to wind tunnels, propulsion benches and flight tests.

STAGE SEPARATION AEROTHERMODYNAMICS

Weiland, Claus, Daimler-Benz Aerospace A.G., Germany; Aerothermodynamics and Propulsion Integration for Hypersonic Vehicles; Oct. 1996; 28p; In English; See also 19970009247; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Aerothermodynamic problems during the sequence of ascent flight are investigated. The flows for the pickaback configuration, the stage separation, the lower stage alone, inside of the trough of the lower stage and the fin/winglet interaction are considered. The main attention will be drawn to the stage separation process. During hypersonic flight the upper stage is separated from the lower stage which induces thereby a highly complicated flow field in the gap between the both stages, leading to aerodynamic and thermal loads. From the flight mechanical point of view the aerodynamic coefficients have to be determined, whereas for structures and thermal protection purposes the local loads are of most importance. Several physical aspects are examined for the various kinds of flows, i.e., wall radiation, turbulence, real gases, shock/boundary layer and shock/shock interaction, flow separation and reattachment. The flowfields are analyzed by employing numerical simulation methods as well as wind-tunnel experiments. Inviscid and viscous numerical simulations are performed applying the Euler and the Navier-Stokes equations. The influence of the grid fineness on the accuracy of the numerical results are also object of consideration. Results of the above described flow

cases will be presented and discussed in very detail and the wind-tunnel data will be compared with the numerical results for validation reasons.

As in all other industries, the space industry is evolving in three primary areas: technology, costs and socioorganisational approaches. A project conducted in CNES aims to revise the definition of future space systems with the introduction of global methods and computer-aided tools. One of the main goals is the definition and the development of a Workbench for missions and space systems design. It will be composed of a certain number of design and simulation tools dealing with unique and coherent information shared between different viewpoints. Operated in CNES, this computer-based Workbench will focus on the early stages of projects but will also treat first order or 'simplified' models which are managed daily during the projects' life span, in accordance with the detailed models from industry.

INTELLIGENT DECISION AIDS FOR HUMAN OPERATORS
Winter, H., Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Germany; Champigneux, G., Dassault Aviation, France; Reising, J., Wright Lab., USA; Strohal, M., Universitaet der Bundeswehr Muenchen, Germany; Future Aerospace Technology in the Service of the Alliance; Dec. 1997; Volume 2; 20p; In English; See also 19980016571; Copyright Waived; Avail: CASI; A03, Hardcopy; A02, Microfiche

The paper describes the concepts and architectures of intelligent decision aids, which are designed to support human operators in complex mission systems. It starts with a discussion of models for human decision making. These models are used to develop the concepts for intelligent technical devices - like monitoring or diagnosis systems for situation assessment, planning or decision aiding systems for the preparation of actions - which are built to support certain subfunctions in the human decision making process. Several examples of decision aids are presented, which have been developed in the USA, France and Germany. The goal is that the detailed presentation of these projects, together with the discussion of experiences and lessons learned from the implementations shall help potential builders of intelligent decision aids to design similar systems. The areas of application of these decision aids range from air vehicle management and aircraft mission management to air traffic management and command and control systems. The principle of coupling work systems for the modelling of complex and distributed decision making processes is discussed and applied to air traffic management and command and control.

This paper provides a framework for exploring ways of reducing the amount of testing required in the process of structural qualification. From a review of the current process, it identifies five areas for particular consideration: structural analysis, design data, loading and environment, the structure, and qualification testing. For each, a brief description of the implications of reduced testing is given together with areas for improvement which are either ongoing or proposed.

This paper will outline British Aerospace's (BAe's) development of Cost Prediction/Management methodologies and toolsets and their relationship to feature based modelling. It will place these developments within the context of the in-house implementation of Integrated Product Definition (IPD) currently being addressed within BAe Military Aircraft & Aerostructure's (MA&A's) requirements for Business Process Re-engineering (BPR) and Operational Efficiency Improvement (OEI). An outline of BAe's commitment to the philosophy and implementation of Integrated Product Development is given in Section 2. Section 3 provides a history of Cost Engineering and its Design to Cost (DTC) toolset developments. Multi-Disciplinary Optimisation (MDO) as an enabler to efficient Cost Prediction is discussed in Section 4 together with an example of an MDO toolset currently in use within BAe's Airbus Operations Company at Filton. Section 5 introduces Feature Based Costing. How "features" relate to both the design and costing processes is discussed together with an outline of BAe MA&A's development of its "Cost Prediction and Management system" pilot study. Conclusions related to the Cost Prediction process and the importance of "features" are offered in Section 6.

SKUNK WORKS LESSONS LEARNED

Nicolai, Leland M., Lockheed Martin Corp., USA; Strategic Management of the Cost Problem of Future Weapon Systems; Sep. 1998; 12p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

In order to manage a weapon system's cost you must first establish cost as the #1 priority and then incite the program manager and give him the means necessary to hold to the cost. Establishing cost as #1 is a company edict and may require a cultural change. The program manager must be a zealot about cost because he will be pressured daily to relax cost in favor of more traditional metrics (i.e., performance, cost effectiveness, signature, etc.). Kelly's 14 Rules gives the program manager the authority and environment necessary to control the cost.

'COTS': CUSTOMIZATION, OPPORTUNITIES AND TRADE-OFFS
Delaney, R. Grant, National Defence Headquarters, Canada; Sep. 1998; 12p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The aim of this paper is to describe the methods by which the Canadian Armed Forces (CF) balanced a commercial off-the-shelf (COTS) process by customization, opportunities and trade-offs (also COTS) as an example towards meeting the cost challenges of the 21st century. This paper will present a description of the specific customization efforts and associated trade-offs as they apply to the CH146 acquisition and fielding. It will not focus on cost benefit opportunities per se as these issues have been discussed in a previous paper. Some repetition of information will be unavoidable in illustrating opportunities achieved in the CH146 helicopter acquisition and introduction into service. Nor is it intended to discuss the decision making process resulting in the opportunity to acquire a common fleet of helicopters to replace three to four types of aircraft. The comparative arguments should allow the reader to make his or her own conclusion in respect of the ability of this aircraft to meet challenges of the future in your own individual programs.

SAGEM Company is a dual enterprise within which the manufacturing of military equipment benefits by having an industrial tool base and skills that are shared with civilian activities. An inquiry conducted in these sectors has, however, allowed us to elucidate certain factors which generate excessive cost for military equipment. Analysis of these factors demonstrates that the situation of needs and industrial organizations are greater generators of excessive cost than are the specific constraints of the military.

COST MANAGEMENT PROCESSES FOR SATELLITE COMMUNICATIONS SYSTEMS: LESSONS LEARNED

Brackey, Thomas A., Hughes Space and Communications Group, USA; Drennan, Richard M., Hughes Space and Communications Group, USA; Sep. 1998; 6p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

A satellite is a spacecraft bus and an integrated payload designed to perform a mission in space. Satellite systems encompass assigned orbital slots, launch support services, a space control segment, and terrestrial communication links for an end-user. Value added data-to-information regimen to fulfill customer demands for specified services is the objective. Satellites are not considered separately from these other segments but complementary to the system.

Hughes Space and Communications (HSC) cost-management experience focuses on the satellite because we develop and manufacture satellite systems for domestic and international customers. Currently, 64 Hughes-built commercial satellites are in service in the USA and around the world, with a spacecraft reliability record of better than 99%. We also purchase blocks of launch services from the international launch vehicle community and either own or lease tracking, telemetry, and commanding services and provide technical support for customer operations. These require long-lead procurement to manage cost effectively and to pass these savings on to our government and commercial customers. Cost, schedule, technical performance, and customer focus are the key factors that shape our integrated management strategy with respect to cost management. These are essential to secure and assure our continued success as a viable business. In the USA, government, aerospace, industry, and academia have teamed to sponsor a "lean aerospace manufacturing initiative". The strategy is lean because it does more with less—often much less. It cuts cost and reduces cycle time while improving productivity and quality. The lean aerospace manufacturing industry initiative, with emphasis on the end customer, value streams, customer-forward manufacturing and assembly, leading-edge technology insertion, and quality assurance is exceeding performance projections and reducing mission life cycle costs. Similarly, our cost and management process has significantly increased employee productivity by 47% and reduced costs and cycle times by 30% and is widely emulated within the satellite industry. Therefore, the emphasis of this paper is on the satellite manufacturing enterprise, reduced cycle times, and the changes in business practices and processes needed to satisfy the customers' contractual demands.

THE BOEING 777: A LOOK BACK

Glende, Wolf L., Boeing Commercial Airplane Co., USA; Sep. 1998; 12p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The Boeing 777 is the largest twin-engine commercial jet transport in service today. In 1990, approval to proceed with its development was contingent on defining an airplane the airlines would buy at a price Boeing could afford. Innovative processes were developed and implemented that focused on achieving customer preference and reduced program cost. These processes centered on Design Build Teams, Digital Product Definition, and Digital Preassembly. Two years after delivery of the first airplane, the data show that the processes made the 777 the preferred airplane, lowered program costs as predicted, and set new standards and expectations for the development of jet transport aircraft.

THE DESIGN AND MANUFACTURE OF AN ALL-DIGITAL V-22

Dougherty, J. J., III, Boeing Co., USA; Liiva, J., Boeing Co., USA; Sep. 1998; 8p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The production V-22 has incorporated the latest technologies and computer-aided techniques and manufacturing processes. These are: (1) CATIA(TM) (Computer-Aided Three-Dimensional Interactive Application) for design. A single authority digital data base that contains all the design information; (2) Digital electronic mockup (EMU) to determine part fit-up and resolve interface problems during the design phase through Digital Pre-Assembly (DPA), instead of creating panic on the assembly line; (3) Concurrent Product Development using over 80 Integrated Product Teams (IPTs) consisting of engineering, tooling, manufacturing, supportability and subcontractor disciplines, working simultaneously on each major part of the aircraft to ensure a "balanced" design. The multiple customers for the V-22 aircraft, USMC, USN, and USAF/SOCOM, are an integral part of the IPTs. An Analysis and Integration (A&I) team ensures consistency across interfaces and an Integrated Test Team (ITT) of contractor and customer personnel perform flight testing; and (4) Manufacturing process improvements including the utilization of part features to

locate and assemble components; fiber placement of large pieces of composite structure with simple and compound curvature; high speed machining of large monolithic pieces of metallic structure rather than assembling them from pieces; laser optical layout templates driven from the CATIA(TM) data base to locate composite plies during lay-up; robotic trim and drill cells; automated creation of wiring form boards and numerically controlled, CATIA(TM) data base to locate composite plies during lay-up; robotic trim driven, automatic bending of hydraulic tubes. The results of using these new technologies and processes are compared with 1980's methods.

The strategic management of the cost issue is of major importance for any company; basically, the question is to combine the customers' satisfaction and the company's profitability. The customers' satisfaction is met with agreeable and affordable levels of price and performance of the products and systems they buy. The company's profitability is needed to meet the basic rules of capital and strategic investment. In our so called "high tech" companies we have also to take account of the huge level of R and D required to run our projects and programs. More and more, this R and D is partially, if not totally, self-funded by the company itself. Furthermore, cost management must enable us to get the resources which are needed to be in the position to study, then develop and produce the future systems which will be in the Forces, our customers. Many answers can be given to this difficult question of cost management. After having introduced my company, THOMSON-CSF/Radars et Contremesures (RCM), and our main airborne systems, I will address our global methodology dedicated to these systems' studies and developments. This methodology, without any doubt, is the fundamental core of our know-how, not only relying on more or less heavy and sophisticated tools, but also and above all fed by the unique skill of our staff, for decades. Charts outlining RCM and its products and systems overview are presented.

THE AERMACCHI YAK/AEM-130 AND AT-2000 DESIGN OBJECTIVES: A TOPIC IN THE SUBSONIC VERSUS SUPERSONIC TRAINING TRADE-OFF

Lucchesini, Massimo, Aeromacchi S.p.A., Italy; Iaia, Pierclaudio, Aeromacchi S.p.A., Italy; Sep. 1998; 12p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

A modern trainer should be designed in accordance with the needs imposed by the entry into service of new and more capable operational aircraft. The trainers currently in service were designed, at best, with late 60's generation fighters in mind. The introduction of a modern trainer into service will allow substantial savings, over their life-cycle, with respect to the existing advanced trainers, even if updated with state-of-the-art avionic systems. This paper deals with the cost-effectiveness of selecting a subsonic or a supersonic configuration as a baseline. The result of a quantitative evaluation, carried on a representative training scenario, shows that the higher costs of a supersonic configuration will not be paid by the reduction in training costs, and that the optimal baseline is still a subsonic trainer, designed to be representative as much as possible of the modern combat aircraft.

JOINT STRIKE FIGHTER: COST MODELING IN THE JSF

Younossi, Obaid, Department of Defense, USA; Sep. 1998; 10p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

This paper is about the Joint Common Cost Model(JCCM), a cost model developed to meet the unique challenges of estimating the cost of the Joint Strike Fighter Program. The cost model was developed to estimate the cost of a family of aircraft with maximum design and manufacturing commonality which meets the requirements of the USA Navy, Air Force, Marine Corps as well as the UK's Royal Navy. The JCCM incorporates the effect of commonality among different Service variants, the cost of advanced material composition, the cost of low observability, the costs of a robust avionics suite, the costs of a propulsion system capable of conventional flight and short take off and landing, and the cost effects of affordability initiatives in the area of Producibility and Manufacturing. to our knowledge a model that meets these difficult requirements had not previously been developed.

SIMEN: AN IN-HOUSE SIMULATION TOOL, REDUCING RISK AND COST FOR THE NSM DEVELOPMENT PROGRAM

Drogset, Gunn Helene, Kongsberg Gruppen ASA, Norway; Sep. 1998; 4p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

This paper describes the simulation tool (SIMEN) developed to support a cost-effective and low-risk development of the new anti-ship missile (NSM) for the Royal Norwegian Navy (RNoN). Missile test firings are very expensive, difficult to plan and predict, and they seldom cover all test scenarios. Therefore, computer simulations in our missile programs have become more and more important as powerful computers and SW tools are getting more cost-effective. Powerful visualizations of simulations make SIMEN a useful tool for everybody working with NSM. One of the main goals with the use of SIMEN is to help the project detect errors in the missile system as early as possible to minimize the costs and technical risks.

PARAMETRICS AS AN ADEQUATE COST ESTIMATION TOOL FOR AFFORDABLE HIGH-TECH PRODUCTS

Wenzel, Meinolf, Daimler-Benz Aerospace A.G., Germany; Strategic Management of the Cost Problem of Future Weapon Systems; Sep. 1998; 26p; In English; See also 19990008074; Original contains color illustrations; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

It is my understanding that this panel of AGARD deals with highly sophisticated technical matters, extending the edge of technology into the unknown and satisfying the human mind in so far as it gives a better understanding of physics and nature and hopefully has very practical consequences for applications. My subject deals with the affordability of such applications. This means an understanding of nature as well but it is the human nature and human behavior in engineering groups and program teams consequences that matter if we want to understand the ultimate cost drivers that are the key elements of cost origination.

This paper describes Kongsberg Defence & Aerospace's (KDA) work in the implementation of Concurrent Engineering (CE) practices. The work has been done through an internal improvement project, IPF. The paper provides information about background, methods, tools, supporting techniques, verification examples and results. It documents results showing that adaptation of the CE practices can lead to a tremendous savings in project cost and time.

CMT: AN INNOVATIVE SYSTEM FOR PROJECT RISK MANAGEMENT

Pedersen, F. B., Det Norske Veritas, Norway; Tomte, E., Norwegian Air Material Command, Norway; Sep. 1998; 10p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

A risk management system called Criticality Management Tools (CMT) /1/ is introduced. This system (procedures and software tools) supports a preventive and proactive approach, which enables early identification of hazards and risk affecting the project objectives. The hazards may originate from a broad range of disciplines, such as economy, politics, technology, environment, etc. An information management module contains the resources needed to perform risk monitoring and controls experience data collected from surveys and pilot projects. These data will be continuously updated with experience gained through the use of CMT in ordinary projects.

PAST AND FUTURE PROGRAMMES: A VIEW ON COST MANAGEMENT EVOLUTION AND CHALLENGES

Lojacono, E., Alenia Aeronautica, Italy; Mazzetti, B., Alenia Aeronautica, Italy; Sep. 1998; 8p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The challenge of meeting the requirements for an effective air combat capability in the future, constrained by ever more demanding budgetary limitations, must be faced in the broadest possible terms to identify the affordable solutions. Cost analysis of a weapon system must consider the entire life cycle of the system, from initial concept and realization of the first series through the variants which scenario requirements and technological evolution impose on the system to maintain an operational capacity which meets the demands of intended use. The cost of a program in its entirety, i.e. the Life Cycle Cost (LCC), is essentially determined by the physical parameters of the system produced and the process by which it is realized and managed: it is of course true to say that developments both in the recent past and currently in evolution have led to techniques and procedures which aim to reduce such effects to a minimum. However, in general terms, the level of cost is determined by factors of a general nature which reflect the system requirements and the contractual framework within which it is developed, acquired and managed during its lifetime. Experience gained in various programs operative during these years in which cost management techniques have been identified and to a certain extent put into practice, suggests the need to cross-analyze such elements of cost control: in a similar way to the constraints of requirements and contractual typologies they can condition the effectiveness of the techniques and procedures of cost management.

COST EFFECTIVENESS IN UK DEFENCE PROCUREMENT: THE COEIA

Lindop, A. J., Ministry of Defence, UK; Sep. 1998; 20p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A03, Hardcopy; A03, Microfiche

The UK has recently adopted a process for obtaining the most cost effective equipment for its armed forces, known as the Combined Operational Effectiveness and Investment Appraisal (COEIA). The role that the COEIA fulfills in the current UK defense procurement

practice is explained and compared with previous practices. An outline of the process of selecting a Class of Military equipment by means of a Balance of Investment study is followed by a description of how to select the most cost effective Type of Equipment within a class using a combination of investment appraisal and estimating the military effectiveness of the equipment. The investment appraisal process for an aircraft system is described in terms of selecting the alternative procurement options, defining the assumptions, examining the cost breakdown structure, discounting the expected cash flow and analyzing the risks and uncertainties. The different mechanisms for measuring operational effectiveness are examined in order to explore the military benefit which is expected from the alternative options. In conclusion, alternative ways of combining cost and effectiveness are illustrated graphically to show how the most cost effective option for the procurement could be derived.

THE FUTURE FOR COMBAT AIRCRAFT DESIGN: AN INDUSTRIAL VIEW

Skorczewski, L., British Aerospace Public Ltd. Co., UK; Sep. 1998; 4p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A01, Hardcopy; A03, Microfiche

The paper addresses the design and technology drivers which are likely to have the most impact on the next generation of combat aircraft from an industrial perspective. The nature of future conflicts and the emerging threats are becoming increasingly difficult to predict, and operational needs stress the growing importance of flexibility and survivability to meet these indefinable future scenarios. The inescapable fact is that market forces are no longer able to support 'performance at any cost' because defense budgets worldwide are being reduced and there is increasing competition for fewer orders. The key attribute of any future combat aircraft is now AFFORDABILITY, and the technology and design drivers which find their way into new combat aircraft will be those which provide major life cycle cost savings, whilst meeting adequate performance margins. The processes and mechanisms associated with achievement of major cost savings are discussed as a means of industrial survival in an increasingly competitive and uncertain world.

AGILE MANUFACTURING: MYTHOLOGY OR METHODOLOGY?

Eastham, J., British Aerospace Public Ltd. Co., UK; Sep. 1998; 10p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The 'lean manufacturing' concept is well known and its application through the use of principles such as Pareto analysis, Kanban, JIT and WIP (etc) has the potential to realize significant cost benefits. There is, however, a potential down side to the 'lean and mean' environment; a reduced ability to respond to change. The need for a level of flexibility in the overall manufacturing process has therefore been recognized. Flexibility can be planned into the process at an early stage, perhaps as an intrinsic part of a risk management exercise for example, but such processes tend to be flexible only within the pre-set boundaries. In practice, however, the operational environment may be subject to a wide range of intrinsic and extrinsic variability which cannot be accounted for during the planning stage. More recently a new concept has begun to emerge which seeks to address the above issue; Agile Manufacture. The concept remains somewhat vaguely specified at present and has been variously interpreted as synonymous with 'flexibility', 'responsiveness' and even 'lean'. Alternatively Agile Manufacture may be seen as a new approach to production which encompasses flexible engineering methods and operations management. This paper addresses the agile concept from a manufacturing viewpoint and seeks to understand if agility is in fact a 'paradigm' or merely new coinage for an old currency.

COST CONTROL IN THE DEVELOPMENT OF SYSTEMS AND THEIR SOFTWARE LA MAITRISE DES COUTS DANS LE DEVELOPPEMENT DES SYSTEMES ET DE LEURS LOGICIELS

Padel, P., Aerospatiale Missiles, France; Sep. 1998; 8p; In French; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

Being both a systems developer and missile builder, Aerospatiale Missiles deals with systems that include a high proportion of software. Depending upon the type of product (integrated systems for command, fire control units, missiles, associated equipment), the software portion is generally greater than that of the hardware. The definition of a system results from studies which allow one to identify and characterize the function and architecture (technical solutions). These technical solutions are the result of technological choices that can result from arbitration among all of the software and all of the hardware, or of intermediate blended solution. The forecasted cost of software is highly dependent on the choices that are made and therefore cannot be independent from that of the the rest of the system.

Science and Technology (S&T) programs can have critical impact on the cost of aeronautical systems. The problem is to teach S&T personnel how to deal with the impact that their technologies have on cost as well as they deal with the technical performance impacts. The U.S. government focus on affordability in defense system procurement has provided a timely opportunity for initiatives to be developed and put in place. This paper discusses some of those government initiatives and some of those found in industry. Results are presented. The benefit of addressing four areas concurrently will be discussed. They are: Culture change, including the use of Integrated Product and Process Development (IPPD) and Integrated Product Teams (IPT), use of appropriate metrics, emphasis on transition of technologies to acquisition programs, and timely education and training.

19990008094 Department of Defense, Joint Strike Fighter Program Office, Arlington, VA United States

TECHNOLOGY: SOLUTION FOR THE NEXT GENERATION OF AFFORDABLE STRIKE FIGHTERS

Schwartz, Frederic C., Department of Defense, USA; Sep. 1998; 8p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

An essential element of the Joint Strike Fighter Program is the specific application of technologies to significantly reduce the life cycle cost of the weapon system. The strategy is to aggressively attack those attributes and features, which are high cost drivers for a strike fighter weapon system through various innovative approaches. The Joint Strike Fighter Program has addressed this by: 1) Identifying those specific features and characteristics which are high cost drivers so that one can apply scarce resources to the most leveraging attributes; 2) applying the Strategy-to-Task-to-Technology methodology and Quality, Function and Deployment(QFD) analysis to logically prioritize investment strategies; 3) identifying and leveraging opportunities for common technology demonstrations which apply to multiple

weapon system concepts; and 4) coordinating activities across the various Science and Technology(S&T) communities to target significant life cycle cost drivers for strike fighter platforms.

As was mentioned in the general presentation, one of the goals of our symposium is to examine government prospects with respect to management of programs in order to achieve realistic cost, or to allow common adoption of better practices in order to take up the challenge of costs. The text which follows is not a comprehensive or official presentation of the new General Directorate for Weapons (DGA) in France. On the contrary, it reflects, in the same spirit of our symposium, an analysis by one member of the FVP committee which works with DGA, regarding the advantages which the French department gains after or during its reorganization. Without attempting to be comprehensive here, we will only deal with advances which are directly related to the theme of the symposium.

In response to the changing defense environment and political and economic pressures, UK non-nuclear defense science and technology capability has been drawn together as the Defense Evaluation and Research Agency (DERA). The agency remains a government organization but operates as a trading agency supplying its services to customers (principally in the UK MoD) on a full cost basis, and required to demonstrate best commercial practices and financial viability. This paper traces the early days as the Defence Research Agency (DRA) through to its current structure, highlighting some of the challenges along the way, and sets out some future initiatives to maintain its position.

COST REDUCTION STRATEGIES IN ACQUIRING AIRCRAFT WEAPON SYSTEMS AT "PAX RIVER"

Zalesak, Philip F., Naval Air Warfare Center, USA; Sep. 1998; 10p; In English; See also 19990008074; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

The most significant consolidation in the U.S. Department of Defense (DoD) just occurred at the Naval Air Station in Patuxent River, Maryland. This air station is commonly referred to as "Pax River". The U.S. Navy collocated its aircraft program managers, developers, testers, procurement, and logistics personnel at Pax River to achieve greater efficiency and effectiveness in buying aircraft weapon

systems. The purpose of this paper is to discuss this consolidation and the tremendous research, development, test and evaluation (RDT&E) capability now resident at this site.

The Directory of Defense and Aerospace Information Centers is a reference guide to information centers located in NATO nations. The information provided represents submissions from forty eight information centers across fourteen countries. The guide provides assistance in locating scientific and technical information resources from several countries' information centers. Points of contact are provided for each center. The directory includes information on: points of contact, subject coverage, description of major products and services, access limitations where applicable, e-mail addresses, and phone and fax numbers. An index to centers by organizational title is included for quick reference.

Report No.(s): AGARD-INDEX-92-94; ISBN 92-836-1019-9; Copyright Waived; Avail: CASI; A22, Hardcopy; A04, Microfiche

This volume provides abstracts and indexes for AGARD unclassified publications published during the period 1992-1994. Full bibliographical citations and abstracts for all the documents in this publication are given in the abstract section, which is organized in the major subject divisions and specific categories used by NASA in abstract journals and bibliographies. The major subject divisions are listed, together with a note for each that defines its scope and provides any cross-references. Category breaks in the abstract section are identified by category number and title, and a scope note. Within each category, the abstracts are arranged by series and year. Six indexes - Subject (based on NASA Thesaurus nomenclature), Personal Author, Corporate Source, Panel, Report/Accession Number, and Accession Number - are included. Sample entries are shown on the first page of each index. This publication was sponsored by the Technical Information Committee of AGARD (TIC), and compiled by NASA's Center for Aerospace Information (CASI).

GUIDE TO MULTIMEDIA STORAGE LE GUIDE DES MEMOIRES MULTIMEDIA

Sep 1, 1995; 92p; In English

Report No.(s): AGARD-AR-341; NIPS-95-06086; ISBN 92-836-1024-5; Avail: CASI; A05, Hardcopy; A01, Microfiche

The guide to multimedia is a review of the current storage devices available for accessing, retrieving, and storing information. The discussion addresses the principal devices available. A selected bibliography is provided as a reference tool for further inquiry. The type of multimedia devices used in an information storage and retrieval environment will vary with the size of the collection, the demand for

information, and the retrieval capability required. While there are several methods of storage available, ease of access, cost, reading and writing capabilities, and durability are a few of the issues that should be addressed in determining the needs of an information center. This guide provides information on twelve major storage devices. A description is provided on their benefits, limitations, durability, platform capabilities, comparison, storage capacity, physical characteristics, data capacity, ease of use, copying capability, cataloging rules and data standards. There are three major groupings to this guide. The first is optical storage capability. CD-ROM, optical disk, and photo CD are reviewed. The second is magnetic storage. This grouping includes magnetic tape, video tape, tape cassette and cartridge, floppy disk, hard disk, and removable storage systems. The third grouping is defined as other media storage. Photo media, audio material and motion picture comprise this group. Regardless of the storage device used, the key is effective management to enable immediate access to information when required.

AN INTEGRATED THEATER BATTLE MANAGEMENT C2 ARCHITECTURE BASED ON COMMERCIALLY AVAILABLE SOFTWARE

Green, Edwin J., Mitre Corp., USA; Krutsch, Michael C., Mitre Corp., USA; Oct. 1995; 10p; In English; See also 19960016897; Copyright Waived; Avail: CASI; A02, Hardcopy; A03, Microfiche

For the past two decades, 'stove-pipe' Command and Control (C2) information systems have proliferated within the Department of Defense (SOS). This proliferation has resulted in duplication of development effort, systems which are not interoperable, and large life-cycle costs. To a large extent, these systems have been built with uniquely developed software. Much of this unique software constitutes what is commonly referred to as the software infrastructure (e.g., system level services and support services for mission application software). For Theater Battle Management (TBM) C2 information systems, the software infrastructures are inherently the same with regard to the functions and services they provide. Technically, these systems could benefit from a common software infrastructure. With advances in the commercial software market, the realization of such a common infrastructure no longer needs to rely on uniquely-developed software. The commercial marketplace provides solutions for significant portions of the software infrastructure based on open systems standards and mature standards-based products.

By means of statistical considerations it is possible to derive a classification rule which is optimal in the sense that, on an average basis, its use yields the lowest probability of committing classification errors. This statistically optimal classification rule is a generally accepted standard against which the performance of other classification algorithms are often compared. As is true in many fields which deal with measuring and interpreting physical events, statistical considerations become central in Automatic Target Recognition because of the randomness under which classes are distributed in sensory data. There has been considerable investment in real time Automatic Target Recognition Systems that employ multiple-sensor and multiple-look evidence accumulation strategies. These ATR's exploit predetermined models of the targets and target states using correlation

matching processes to declare targets or target features and various detector forms and graph matching techniques to accumulate evidence. Due to the nature of the sensors and environment, it is not clear that these algorithms can be cast in an optimal fashion; however, given a selected training and test set much can be said about the respective performance. It is this benchmark by which this paper measures performance. To this end, techniques for estimating the probability of errors inherent in the sampled data sets and the calculations of bounds on this measured performance are investigated.

Geographic data were used very early on for cruise missiles and long-range operational aircraft in connection with navigation functions, such as navigation readjustment and very-low-altitude navigation. Two types of data were used for navigation readjustment: relief data (DEM: digital elevation model) or topographic data (landmarks or seamounts); for very low-altitude navigation: essentially relief data. The development of observation satellites starting in the seventies made it possible rather quickly to assemble big relief databases; the preparation of the MNT (numerical terrain model), from a stereocouple, is largely automatic and thus needs little operator action; on the other hand, one may think that, when it comes to large surfaces, relief constitutes information that is rather stable in terms of time so that it can be prepared rather far in advance, contrary to planimetric data (cultural features) that are of a more ephemeral nature.

AN INTERNATIONAL AEROSPACE INFORMATION NETWORK: IAIN FINAL REPORT

Feb. 1998; 30p; In English

Report No.(s): AGARD-AR-366; ISBN 92-836-1070-9; Copyright Waived; Avail: CASI; A03, Hardcopy; A01, Microfiche

Reports the outcome of the deliberations of a Working Group set up by the Technical Information Committee of AGARD to examine the models of existing cooperative international databases and make recommendations for the establishment of such a database to serve the aerospace sector. The report recommends the Internet as the most suitable vehicle for this and describes a prototype International Aerospace Information Network (IAK Homepage which was developed by the Group for use as a Proof of Concept. In this prototype Homepage, which is intended to be a limited version of the finished network, several connections have been made to information sources as a demonstration of the concept and the capability that would be inherent in the final stage. It is stated that in order to deliver the desired data and information and needed services to the user, the network should include: the ability to search for aerospace and aerospace-related data and information across heterogeneous systems aerospace and aerospace-related data directory information the facility to order data products through a simplified 'one-stop shopping' procedure the delivery of data to users on a variety of standard media, including electronic delivery where appropriate.

Real-time interpretation of large amounts of battlefield information by both operator and system is increasingly difficult due to steadily growing complexity, and integration of systems. Therefore data fusion, i.e. combining data from several sources in order to obtain a global and coherent view on the battlefield, both at sensor level (multi sensor data fusion) and at abstract, strategic information level (information fusion), becomes more important. In this paper we will describe the different concepts used for the multi sensor data fusion processes, and the distributed asynchronous software architecture chosen. Furthermore, the interaction between Data Fusion, Situation Assessment and Sensor/Platform Management will be explained in order to Sensors/Platforms illustrate the applied technologies for advanced information processing for multisensory systems. In the paper some of the first results from this on-going project will be presented.

British Aerospace Military Aircraft and Aerostructures (BAE MA&A) has conducted various studies on the topic of Data Fusion. This paper highlights developments which, it is thought, offer a significant step towards optimum situation awareness. It examines sensor data quality, the fusion process and method function. The paper also examines the key issues affecting quality of track data fed into the fusion process by Electronic Support Measures systems (ESM), the prime threat identity data. Emitter recognition and location issues are discussed and potential routes are proposed to attain the necessary performance increases to support optimum situation. However, lack of adherence to a known plan is not a conclusive awareness.

DATA FUSION FOR LONG RANGE TARGET ACQUISITION

Verlinde, Patrick, Royal Military Academy, Belgium; Borghys, Dirk, Royal Military Academy, Belgium; Perneel, Christiaan, Royal Military Academy, Belgium; Acheroy, Marc, Royal Military Academy, Belgium; Apr. 1998; 10p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

An approach to the long range automatic detection of vehicles, using multi-sensor image sequences is presented. The algorithm we use was tested on a database of six sequences, acquired under diverse operational conditions. The vehicles in the sequences can be either moving or stationary. The sensors are stationary, but can perform a pan/tilt operation. The presented paradigm uses data fusion methods at four different levels (feature level, sensor level, temporal level and decision level) and consists of two parts. The first part detects targets in individual images using a semi-supervised approach. For each type of sensor a training image is chosen. On this training image the target position is indicated. Textural features are calculated at each pixel of this image. Feature level fusion is used to combine the different features in order to find an optimal discrimination between target and non-target pixels for this training image. Because the features are closely linked to the physical properties of the sensors, the same combination of features also gives good results on the test images, which are formed of the remainder of the database sequences. By applying feature level fusion, a new image is created in which the local maxima correspond to probable target positions. These images coming from the different sensors are then combined in a multi-sensor image using sensor fusion. The local maxima in this multi-sensor image are detected using morphological operators. Any available prior knowledge about possible target size and aspect ratio is incorporated

using a fusion (also called score or measurement level fusion), medium region growing procedure around the local maxima. A variation to this approach, that will also be developed in this paper, combines the previous feature and sensor level fusion, by extracting the features in each sensor as before but using the from all sensors in what is sometimes called a <super feature vector>. Tracking is used in both cases to reduce the false alarm rate.

MULTISENSOR DATA FUSION FOR AUTOMATIC RECOGNITION OF HIGH VALUE SURFACE TARGETS

Bers, K.-H., Forschungsinstitut fuer Informationsverarbeitung und Mustererkennung, Germany; Essen, H., Forschungsinstitut fuer Hochfrequenzphysik, Germany; Jaeger, K., Forschungsinstitut fuer Informationsverarbeitung und Mustererkennung, Germany; Schimpf, H., Forschungsinstitut fuer Hochfrequenzphysik, Germany; Apr. 1998; 8p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

This paper describes a system for surveillance and target recognition for autonomous stand-off weapons based on the interpretation of multisensor data in combining the individual sensor channels to optimize the system performance by intelligent fusion techniques. To meet this demand, we propose a model-based method for the automatic recognition of high value fixed or relocatable surface targets like bridges, airfields, industrial installations and command posts. A production net is used to represent the knowledge about target structures. The analysis is carried out by a knowledge based classification system. Starting with primitive objects extracted separately from each individual sensor channel (low-level-processing), more complex parts are composed step by step until the target object is recognized (high-level-processing). The radar preprocessing comprises a thresholding prescanner and a subsequent feature based discrimination stage, the features making use of polarimetric and geometric properties, and of scattering center statistics. The IR-preprocessing is more related to geometric and structural features like line elements, corners and circles. To enhance the detection probability, in the low level stage a high false alarm rate is accepted as regards the primitive objects. The reduction of the false alarm rate is done in the high level stage by the spatial fusion of 2D- or 3D-structures and by using additional context information of the target environment. The purpose of this paper is to address the state of the algorithms for automatic recognition of high value surface targets. For this, sensor data have been interpreted which were recorded with an imaging infrared sensor and a coherent, polarimetric, high range resolution radar. To enable the spatial fusion process, the raw sensor data were registered together with inertial data of the aircraft. The efficiency of the analysis system is demonstrated by an example involving the detection of command posts. The results show the suitability of the method for future autonomous stand-off weapon systems like drones and missiles with imaging sensors.

USE OF CONTEXTUAL INFORMATION IN MULTIPLE SENSOR TRACKING UTILISATION D'INFORMATIONS CONTEXTUELLES DANS DES ALGORITHMES DE PISTAGE MULTICAPTEUR

Nimier, Vincent, Office National d'Etudes et de Recherches Aérospatiales, France; Apr. 1998; 13p; In French; See also 19980210650; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

In this article we propose a method which allows one to combine symbolic data with numerical data. In order to do this, we propose a process of estimation controlled by a context analysis level. The application anticipated is the merging of data and the algorithms which are inserted in the multiple sensor systems. These algorithms must be designed so that the system will function in a nominal way under all conditions. In order to achieve this, the system must be capable of

adjusting, so that at any moment the evaluation will take into account the context in question. The result will be to make available, in certain contexts, the measurements coming from the sensors in nominal condition of functioning and of reducing the importance of the ones which are aberrational in light of certain criteria which are established in advance by an expert.

SAGESSE: A MODEL OF DATA REPRESENTATION FOR THE MERGING OF SYMBOLIC DATA SAGESSE: UN MODELE DE REPRESENTATION DE DONNEES POUR LA FUSION DE DONNEES SYMBOLIQUES

Pollet, Yann, MATRA Systemes and Information, France; Robidou, Sebastien, MATRA Systemes and Information, France; Apr. 1998; 11p; In French; See also 19980210650; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

A system of symbolic data merging has the goal of developing and processing at any moment the most complete, exact and coherent possible image of an external world during its evolution, called the situation, from uncertain, incomplete and imprecise input data. The modeling of a situation requires representation of the concept of imprecision on the characteristics of the perceived objects, the idea of doubt as to the existence of an object, but also the representation of the hypothetical information used during the reasoning. We present in this report a formal approach which allows one to integrate in a unified way these different ideas in a single representational model, providing them with a precise semantic base. We then describe the application for this approach and the pilot implementation which was carried out under the international program DFD (Data Fusion Demonstrator).

Many different multiresolution fusion methods have been proposed in the literature. An important actual aim in this field of research is to produce colour composites of multiresolution data preserving both the essential spatial information of the high resolution image and the spectral information content of the low resolution channels, so as to produce pseudo high resolution spectral channels which can be further processed for improved classification or other information extraction purposes. The best integration results in this regard have been obtained by the HPF algorithm and by a new fusion method based on multiresolution analysis of the images using the wavelet transform. A new methodology based on adaptive intensity matching filters using local image statistics to spectrally adjust high resolution images to the radiometry of low resolution channels is described in this paper. The algorithm tends to equalize the mean (LMM algorithm) or the mean and the variance (LMVM algorithm) of the high resolution image with those of the low resolution channels, on a pixel by pixel basis, from the values measured within a local window around each pixel position. The INR (Intensity Normalised Ratio) transform, as defined in this paper, is a fast alternative to the RGB-IHS-RGB transform, and allows an efficient implementation of the intensity matching fusion method, generalised to images with more than three channels. These algorithms are applied to a 1024 x 1024 window extract of a high resolution (5m) KOSMOS KVR 1000 panchromatic image to be fused with a registered low resolution (20 m) SPOT XS image, obtained over

the city of Liege (Belgium). The results obtained for varying filtering window sizes are compared with the HPF filter and the wavelet transform applied to the same set of images.

THE FUSION OF ORGANIC AND NON-ORGANIC IDENTITY INFORMATION SOURCES USING EVIDENTIAL REASONING

Bosse, Eloi, Defence Research Establishment Valcartier, Canada; Roy, Jean, Defence Research Establishment Valcartier, Canada; Paradis, Stephane, Defence Research Establishment Valcartier, Canada; Apr. 1998; 12p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

The aim of this paper is to explore the problem of identity data fusion in the context of naval warfare where commanders and their staff require access to a wide range of information to carry out their duties. With the increasing use of the remote sources and the increasing use of information that has already been fused, there is a requirement to define an identity data fusion function that can handle organic and non-organic, local and remote types of information characterized by different accuracy and timeliness. This paper is a step towards the definition of an architecture that can perform the fusion of organic and non-organic identity data through the use of statistical analysis rooted in the Dempster-Shafer theory of evidence. The goal is to offer the decision maker a quantitative analysis based on statistical methodology that can enhance his/her decision making process regarding the identity of detected objects.

The opportunity to process several images being acquired simultaneously over the same landscape in different spectral bands provides a better perception of the scene using data fusion methods. This new method classifying the image in two types (target and background) using the radiometric properties of the surface, is particularly powerful for the detection of non resolved objects. The fusion method is defined by using the normal probability density hypothesis to estimate the of each initial image. The classification is done by using a threshold where analytic expression depends on the type of the a priori knowledge. The method is then applied on an image acquired with the hyperspectral scanner sensor: AVIRIS. The chosen target is a non resolved road in one dimension. Different criteria are used to evaluate the performance of the method: statistical properties, good classification percentage, false alarm and non detection errors. We analyze the a priori probability uncertainty on the image obtained after fusion.

SENSOR SYNERGETICS: THE DESIGN PHILOSOPHY OF THE SENSOR FUSION DEMONSTRATOR AND TESTBED (SFD) AT TNO-FEL

vanderWal, A. J., Physics and Electronics Lab. TNO, Netherlands; Apr. 1998; 26p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A03, Hardcopy; A04, Microfiche

Although the potential of sensor and data fusion as a way to improve situation awareness nowadays is widely regarded as a valuable tool by the military R&D community, there is still little quantitative evidence available that supports the acclaimed benefits of generic fusion methodologies and thus justifies their application. It is therefore legitimate to ask how much value sensor fusion adds to the observation process. In case studies this question is seldom addressed and

it is therefore tempting to ask, whether the acclaimed advantages of sensor fusion are 'hype' or real. In this paper we will try to identify in what situation the application of sensor fusion techniques may be beneficial and which sensor fusion techniques seem to be among the most promising. The starting point of our discussion is the observation that the added value of fusion of similar sensors must originate from a nonlinear combination of sensor data streams. This observation naturally gives rise to the application of novel nonlinear models, e.g. from the area of softcomputing, viz. fuzzy logic, neural networks and evolutionary programming. In addition a trend in research can be observed to apply fusion techniques almost exclusively to 'high-level' fusion (i.e. levels 2 and 3 of the JDL data fusion process model), implicitly considering fusion on the sensor level to be much less of a challenge. Motivated by the fact that high quality primary data are of paramount importance to the success of all subsequent signal processing stages, we argue against this view in this paper. In contrast to the classical data fusion approach, at TNO-FEL it was decided to start up a sensor fusion approach, in which an integrated approach towards sensor optimization, sensor management, and early fusion is pursued. Only in this way one may hope to attain the goal of sensor fusion, viz. an improved situation assessment. Concentrating on the primary information sources, i.e. the sensors, and using their synergy at the earliest stages of signal processing, inevitably forces one to invest in state-of-the-art data-acquisition and real-time (pre)processing facilities. This will be illustrated by discussing some of the design issues of the FEL sensor fusion demonstrator (SFD) testbed. The SFD project has been started up by the end of 1996 and initial concepts have meanwhile been defined. The hardware and software concepts of this testbed will be described as well as the functionality that we hope to implement.

THE NEMESIS IDENTIFICATION DATA FUSION DEMONSTRATOR

Griffith, P. N., Defence Evaluation Research Agency, UK; Hooper, L. A., Defence Evaluation Research Agency, UK; Everitt, W. M., Defence Evaluation Research Agency, UK; Apr. 1998; 7p; In English; See also 19980210650; Copyright Waived; Avail: CASI; A02, Hardcopy; A04, Microfiche

The NEMESIS programme at DERA Malvern was instituted to investigate aspects of multi-sensor, single node data fusion applied to the task of air target identification (ID) in the military environment. In recent years, a reduction of force numbers combined with the introduction of more capable weapon systems, such as precision guided weapons and beyond visual range missiles has made the requirement for accurate, timely, reliable and robust target identification a high priority for air defence forces. After much research during the last 25 years into ID technologies and techniques, it is generally conceded that no single identification technology or system can now nor will, in the foreseeable future, satisfy all the operational capabilities and performance requirements needed from air target identification systems. The enforced use of several identification sensors and sources implies the need for the fusion of the ID data derived from these different sensors and sources. Studies have indicated that automated ID fusion is likely to provide accuracy, consistency, timeliness and manpower benefits. The NEMESIS programme, sponsored by the UK MoD, has investigated the application of a dedicated NATO air target ID data fusion algorithm, NATO STANAG 4162, to a multi-sensor, single node SHORt Range Air Defence (SHORAD) demonstrator system. This paper describes the demonstrator package, the sensors, the fusion process and the results.

Imagery and Signals Intelligence (IMINT and SIGINT) data sources and processing have traditionally followed independent channels, with cross use of the information being achieved only by manual human interaction between users at the end of their respective channels. The characteristics of each of these sources are quite different, making automatic correlation of the data a challenging task, but the rewards of correlated data hold the promise for more accurate and robust surveillance than now available from either independent source. IMINT, for example, is characterized by a low revisit rate, high spatial fidelity and broad spatial context, while SIGINT provides a high revisit rate, low spatial fidelity and a broad temporal context. This paper describes the specific issues that face designers who seek to automatically fuse imagery and signal data - and the methods used to overcome the obstacles posed by the fundamental differences in the data types. Four areas of IMINT-SIGINT fusion are addressed: 1) fusion for cross-cueing and sensor management, 2) fusion for improved target geolocation, 3) fusion for increased target detection and identification confidence, and, 4) fusion for improved visualization of the battlefield. The paper provides examples illustrating future solutions using terrain data, UAV imaging sensors, and real-time-in-cockpit (RTIC) techniques illustrated by ERIM-developed technologies. The integration of these capabilities into joint intelligence systems is illustrated by BTG-developed technologies. The paper addresses two of the specific topics listed in the AGARD call for papers: 1) Applications of multiple sensors and data fusion in - target recognition and surveillance, 2) Sensor data networks across imaging and non-imaging sensors.

A new colour image fusion scheme is applied to visible and thermal images of military relevant scenarios. An observer experiment is performed to test if the increased amount of detail in the fused images can improve the accuracy of observers performing a detection and localisation task. The results show that observers can localise a target in a scene (1) with a significantly higher accuracy, and (2) with a greater amount of confidence when they perform with fused images (either gray or colour fused), compared to the individual image modalities (visible and thermal).

This paper examines how more information and better information can be extracted from UAV data streams, and how that information can be presented to operators in the most effective manner possible. It examines the role of data management in all three phases of tactical reconnaissance: mission planning, mission execution, and post-mission analysis. It then describes some newly-developed tools for precisely positioning each pixel, fusing multiple images, extracting new information, and providing an accessible archive of that information. When implemented successfully, such a data management system can substantially increase the operational value of existing UAVs.

"Information is power" goes the well-known saying, and the military establishment is adamant that the better informed they are, the greater their readiness to overcome foes. This, true though it be, is not enough. The example of the two chessplayers - both having thorough, perfect knowledge of the situation - shows that what gives a significant advantage is not only situational knowledge (assuming the same, high degree of access to information for both players) but also the use that is made of it, i.e. primarily how this variegated mix of data is to be

processed and what strategy can be derived therefrom. Only the transmission of information, from the time it is collected up until when it is dispatched to the user, is addressed in this paper.

Participation in international cooperative programs is giving rise to an interesting experience of test requirement tailoring to define mutually agreed specifications. Significant differences, in particular between the European and U.S. approach, have been pointed out in areas like: qualification/acceptance test philosophies, equipment and system thermal cycling, vibro-acoustic excitation and qualification test article quality standard. The paper focuses on the experience gained in discussing the above points and suggests possible improvements towards an international standard for space testing.

URBAN TECHNOLOGY AND TRANSPORTATION

19950026706 Honeywell Technology Center, Minneapolis, MN, United States

DUAL USE: OPPORTUNITIES, PAYOFFS, AND CHALLENGES

Cunningham, Thomas, Honeywell Technology Center, USA; AGARD, Dual Usage in Military and Commercial Technology in Guidance and Control; Mar 1, 1995, 7 p; In English; See also 19950026705; Copyright; Avail: CASI; A02, Hardcopy; A02, Microfiche

Significant payoffs can be achieved by increasing the interaction between military and commercial business and technology communities. This paper describes a few of the opportunities available to practitioners of guidance, navigation and control technologies to work in this dual use world. Examined from the point of view of an engineer who has been solving primarily military problems, it is hoped that the NATO AGARD reader as well as our new friends from the Cooperating Countries will benefit. The paper emphasizes three major themes: (1) Guidance, Navigation, and Control (G, N, and C) technologies and engineers are highly qualified to solve important nonmilitary problems; (2) The use of common solutions to commercial and military problems, from components to systems, has significant cost payoffs to future affordable military systems; and (3) Commercial systems, particularly aviation, offer technology advantages which should be exploited for affordable non-recurring developments and reduced cycle times in future military systems.

In Sessions 2 to 4 we shall review some of the basic phenomena relevant to capsule aerothermodynamics prior to the more detailed Sessions later in the course. Much of the material in these first Sessions is undergraduate material and refers to simple methods in order to introduce the student to the subject with the emphasis on understanding the phenomena rather than a briefing on state of the art techniques. However understanding aerothermodynamics requires understanding of basic mathematics, physics and chemistry which is assumed for this course. A short list of references is given to each section which has deliberately been kept small such that the student should aim to read all of these in detail. Some of the classic works have been included which although early give good detailed explanations of the subject phenomena. Session 2 Begins with the atmosphere structure followed by some basic thermodynamics used in aerothermodynamics, and ends with a review of the classical aerodynamic and aerothermal regimes encountered by a capsule during entry.

MULTI-SENSOR SYSTEMS AND DATA FUSION FOR TELECOMMUNICATIONS, REMOTE SENSING AND RADAR
LES SYSTEMES MULTI-SENSEURS ET LE FUSIONNEMENT DES DONNEES POUR LES TELECOMMUNICATIONS, LA TELE-DETECTION ET LES RADARS

Apr. 1998; 416p; In English; In French, 29 Sep. - 2 Oct. 1997, Lisbon, Portugal; See also 19980210651 through 19980210690; Original contains color illustrations

Report No.(s): AGARD-CP-595; ISBN 92-836-0051-7; Copyright Waived; Avail: CASI; A18, Hardcopy; A04, Microfiche

This publication reports the unclassified papers presented at a specialists' meeting held by the Sensor and Propagation Panel at its Fall 1997 meeting. The topics covered included: - Applications of multiple sensors and data fusion - Data fusion techniques and methods - Sensor data networks and management techniques - Validation studies, experiments, technologies.

Author

Telecommunication; Remote Sensing; Communication Networks; Data Transmission; Management Methods; Multisensor Fusion

Subject Term Index

(Note: the band of letters below, and on subsequent pages, is for use in the electronic version of this publication and has no relevance to this printed copy)

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

A

A-320 AIRCRAFT

Flying qualities of civil transport aircraft with electrical flight control - 125

A-340 AIRCRAFT

Flying qualities of civil transport aircraft with electrical flight control - 125

ABILITIES

Development of Techniques to Identify Individuals with Superior Potential for Situational Awareness - 318

The USAF's Enhanced Flight Screening Program: Psychological Assessment of Undergraduate Pilot Training Candidates - 327

ABLATION

Ablation - 250

Ablation and Temperature Sensors for Flight Measurements in Reentry Body Heat Shields - 153

ABLATIVE MATERIALS

Ablation - 250

Ablation and Temperature Sensors for Flight Measurements in Reentry Body Heat Shields - 153

ABRASIVES

Overview of paint removal methods - 188

ABSORBERS (MATERIALS)

Novel HF, Radar and IR Absorber Material - 230

ABSORPTION SPECTRA

Characterisation of the Transfer Function of the Clear Atmosphere at Millimetre Wavelengths - 210

ABSORPTION SPECTROSCOPY

Molecular Diagnostics for Rarefied Flows - 257

UV Absorption Measurements of Nitric Oxide Compared to Probe Sampling Data for Measurements in a Turbine Engine Exhaust at Simulated Altitude Conditions - 273

ACCELERATED LIFE TESTS

Ageing and Life Prediction of Composite Propellant Motors - 179

Ageing Behaviour of Composite Propellants - 179

Characterization of the Degradation of the Polymer Binder in GAP-Based Propellants - 180

Development of Methods for Aging and Analyzing Propellants Containing Nitrate Ester Stabilized With MNA and 2-NDPA - 178

Eddy current detection of pitting corrosion around fastener holes - 274

Exfoliation corrosion and stress corrosion cracking behaviour of Al-Li alloys - 163

General Program for Testing Aging Application to an Air-Sol Missile - 186

Instrumented Service Life Program for the Pictor Rocket Motor - 183

Qualification of Chromate-Free Primers for Application to Aircraft Structure - 168

Specific features of corrosion behavior of stainless maraging steels for aerospace application - 163

Structural Service Lifetime Modelling for Solid Propellant Rocket Motors - 184

Test method and test results for environmental assessment of aircraft materials - 163

ACCELERATION

Human Tolerance to Abrupt Acceleration - 306

The Role of Linear Acceleration in Visual-Vestibular Interactions and Implications in Aircraft Operations - 321

ACCELERATION PROTECTION

Advanced Oxygen Systems for Aircraft - 335

Anti-G suits - 355

Current Concepts on G-Protection Research and Development - 334

G-protection basis/acceleration physiology - 334

G-protection capabilities and current G-protection issues - 334

Increase of High-sustained +G(z) tolerance at the expense of pilot's working posture change - 295

Positive pressure breathing for G protection (PBG) - 334

ACCELERATION STRESSES (PHYSIOLOGY)

Cervical Spinal Cord Injury Tolerance under +Gz Acceleration - 297

Medical Screening of Subjects for Acceleration and Positive Pressure Breathing - 301

Negative to positive Gz acceleration transition - 295

Seizure Associated With G-LOC: A Potentially Fatal Occurrence - 297

Task Performance Throughout Prolonged High G Exposure - 321

ACCELERATION TOLERANCE

Cervical Spinal Cord Injury Tolerance under +Gz Acceleration - 297

G-protection basis/acceleration physiology - 334

G-protection capabilities and current G-protection issues - 334

Increase of High-sustained +G(z) tolerance at the expense of pilot's working posture change - 295

Medical Screening of Subjects for Acceleration and Positive Pressure Breathing - 301

Methods for measuring physiological responses and protection in man exposed to high +G(z) - 296

Negative to positive Gz acceleration transition - 295

Neurological Influence in Push-Pull Effect - 297

Positive pressure breathing for G protection (PBG) - 334

Selection and special physiological training of flying personnel to high +G(z)-maneuverable flights-main concept - 316

Selection and training of MiG-29 and future fighter pilots - 317

Task Performance Throughout Prolonged High G Exposure - 321

ACCELEROMETERS

AGARDograph on advanced astroinertial navigation systems - 40

Commercial usage of Navy components developed and manufactured by CRI Delfin - 264

Dual-use micromechanical inertial sensors - 264

Inertial navigation - 39

Vertical channel design considerations - 41

ACCIDENT INVESTIGATION

Applications of Physical Analysis and Crash Survivability - 306

Human Tolerance to Abrupt Acceleration - 306

Investigation of Indy Car Crashes Using Impact Recorders - 340

Situation Awareness: Limitations and Enhancement in the Aviation Environment - 317

ACCIDENT PREVENTION

Burnthrough Resistance of Fuselage and Cabin Structures - 35

Post-Crash Fire Hazards Research - 32

SCARLET: DLR rate saturation flight experiment - 27

The Use of Simulation to Develop an Improved Understanding of Helicopter Tail Rotor Failures and Develop Aircrew Emergency Advice - 79

Thermal and Mechanical Loading on a Fire Protection Shield due to a Combustor Burn-Through - 34

ACCUMULATORS

Elaboration of Cryogenic Transonic Short-Duration Wind Tunnel at ITAM - 140

ACCURACY

A weather forecast utility model for military missions - 293

Accuracy of Computer Codes That Calculate Electromagnetic Cross Sections of Nonspherical Particles - 208

Achieving High-Fidelity Motion Cues in Flight Simulation - 131

Carrier Phase GPS Time, Space, Position Information Demonstration (CAPTIDE) - 46

Cryogenic Internal Balance Calibration at ETW - 137

Force Testing with Internal Strain Gage Balances - 135

Global Navigation Satellite Systems - 43

GNSS Augmentation for High Precision Navigation Services - 45

High Integrity Global Precision Positioning - 53

Integrated GPS/GLONASS User Equipment - 44

Introduction to Global Navigation Satellite System - 43

Navigation Accuracy for Absolute Positioning - 44

Relative and Differential GPS - 44

Requirements on GNSS for Civil Navigation - 44

System Implications and Innovative Applications of Satellite Navigation - 43

ACID RAIN

Clean propellants for space launch boosters - 173

ACOUSTIC ATTENUATION

Active Noise Reduction Flight Tests in Military Helicopters - 338

Next Generation Active Noise Reduction Systems - 338

Personal Active Noise Reduction with Integrated Speech Communication Devices: Development and Assessment - 337

Special Applications of Active Noise Reduction Headsets - 338

The Application of a Proprietary Sound-Attenuating Technology to Passive Circumaural Hearing Protector Design - 337

ACOUSTIC FREQUENCIES

Model and Full Scale Investigations of the Low Frequency Vibration Phenomena of the DNW Open Jet - 142

ACOUSTIC MEASUREMENT

Decision Making Help in the Search for Clear Channels in the Decametric Band - 212

Measurements of Doppler Spread on High Latitude HF Paths - 211

ACOUSTIC NOZZLES

Unsteady Flow Amplification Produced by Upstream or Downstream Disturbances - 241

SUBJECT

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

ACOUSTIC PROPERTIES

Reduction of Tip Clearance and Tip Clearance Noise in Axial-Flow Machines - 107

ACOUSTICS

Aerodynamic and Acoustics of Rotorcraft: A Survey of the 75th Fluid Dynamics Panel Symposium, Berlin - 82

Effects of Active Noise Reduction on Noise Levels at the Tympanic Membrane - 302

General Design Aspects of Low Speed Wind Tunnels - 138

Loads, Dynamics/Vibrations, Acoustics - 83

Reduction of the Noise Signature of the Eurocopter EC 135 - 372

Vocal Agitation as a Predictor of Emotion and Stress - 226

ACOUSTO-OPTICS

Remote Sensing by Active and Passive Optical Techniques - 283

ACQUISITION

Interactive Integration of Passive Infrared and Radar Horizon Surveillance Sensors to Extend Acquisition and Firm Track Ranges - 221

ACRYLIC RESINS

Operational parameters and material effects - 189

ACTIVATION ENERGY

Chemical Safe Life Predictions for Cast Double Base Rocket Propellants - 185

Methods and Kinetic Models for the Lifetime Assessment of Solid Propellants - 179

ACTIVE CONTROL

A quarter century of NASA wind-tunnel and flight experiments involving aeroservoelasticity - 11

Active and Passive Damping Techniques - 278

Active Combustion Control for Propulsion Systems - 161

Active Control of Aeromechanical Stability - 127

Active control technology: Applications and lessons learned - 120

Adaptive Active Noise Reduction Headset for Helicopter Aircrew - 338

Distributed Architectures for Advanced Engine Control Systems - 116

Effects of Active Noise Reduction in Armor Crew Headsets - 338

Effects of Active Noise Reduction on Noise Levels at the Tympanic Membrane - 302

Experiences with ADS-33 helicopter specification testing and contributions to refinement research - 121

Experimental Aircraft Programme (EAP): Flight control system design and test - 124

Flight test results of the F-16 aircraft modified with axisymmetric vectoring exhaust nozzle - 58

Model following control for tailoring handling qualities: ACT experience with ATTHes - 123

Pilot Induced Oscillation: A report on the AGARD Workshop on PIO - 125

Pilot Induced Oscillations - 26

Spacecraft deployable structure testing - 149

Stall Inception and Surge in High-Speed Axial Flow Compressors - 109

Structural aspects of active control technology - 123

System of aeroservoelastic experimental and numerical investigations for aircraft design and certification - 66

System-Level Track Fusion for Command and Control - 222

The Communications Earplug: A Logical Choice for Voice Communications in Aircraft - 337

The importance of flying qualities design specifications for active control systems - 121

The role of handling qualities specifications in flight control system design - 121

The VAAC Harrier Programme: Flying STOVL With 1-Inceptor Control - 117

ACTUATORS

Modelling of a Fuel Control Unit for Small Gas Turbine Engines Featuring Interacting Electronic Linear Actuators - 117

Optimization of Actuation and Cooling Systems for Advanced Convergent-Divergent Nozzles of Combat Aircraft - 115

Smart Aircraft Structures - 91

Spacecraft deployable structure testing - 149

ADA (PROGRAMMING LANGUAGE)

An Approach Towards Integration of a Modular Core Avionics System Kernel - 101

The application of Ada and formal methods to a safety critical engine control system - 344

ADAPTIVE CONTROL

Adaptive Optimization of Aircraft Engine Performance Using Neural Networks - 116

Adaptive strike planning with search path allocation - 361

Neural Adaptive Control of an Engine Exhaust Nozzle - 116

Reconfigurable Flight Control at Wright Laboratory - 129

ADAPTIVE FILTERS

Adaptive Intensity Matching Filters: A New Tool for Multi-Resolution Data Fusion - 385

Analysis of Differential Global Positioning System (DGPS) Techniques and GPS Jamming on Precision Guided Munition (PGM) Performance - 46

ADENOSINE TRIPHOSPHATE

Hypoxia Induced Impairment of Granulocyte Function - 298

ADHESION TESTS

Corrosion protection measures for CFC/metal joints of fuel integral tank structures of advanced military aircraft - 164

ADHESIVE BONDING

Adhesively bonded composite patch repair of cracked aluminum alloy structures - 54

Bolted/Bonded Joints in Polymeric Composites - 190

Cyclic Fatigue and Environmental Effects with Adhesively Bonded Joints - 280

Field repair materials for naval aircraft - 55

Hygrothermal Fatigue of Composite Bonded Joints - 159

Numerical Strength Predictions of Adhesively Bonded Multimaterial Joints - 280

Strength Prediction of Bonded Joints - 280

Stress and Failure Analysis of Bonded Composite-to-Metal Joints - 279

Surface Treatment and Bonding of Thermoplastic Composites - 158

The Assembly of Thermoplastics by Adhesive Bonding: Process and Control - 167

The development of an engineering standard for composite repairs - 58

ADHESIVES

Field repair materials for naval aircraft - 55

Hygrothermal Fatigue of Composite Bonded Joints - 159

Repair of high temperature composite aircraft structure - 56

Strength Prediction of Bonded Joints - 280

ADVANCED TECHNOLOGY LABORATORY

Other Cryogenic Wind Tunnel Projects - 137

ADVANCED VERY HIGH RESOLUTION RADIOMETER

Interpretation of Passive Microwave Radiances for Tactical Applications: Current and Future Capabilities of the Defense Meteorological Satellite Program (DMSF) - 294

Multispectral Remote Sensing of the Coastal Atmospheric Boundary Layer - 292

AERIAL RECONNAISSANCE

Airborne and Spaceborne SAR Systems: Possibilities and Limitations for Military Use - 232

CRECERELLE: A New Generation System of Quick Remote Control for Reconnaissance, Surveillance and Acquisition of Objectives - 364

Integrated Air Deployed Strike Surveillance (IADSS) - 287

NATO Alliance Ground Surveillance Interoperability - 367

The Challenge of UAV Supporting Offensive Air Operations - 369

The Phoenix Target Acquisition and Surveillance System - 364

The Role of Unmanned Tactical Aircraft in the Battlefield Surveillance - 368

AEROAACOUSTICS

A boundary integral method for unified transonic aerodynamic and aeroacoustic analysis of hovering rotors - 10

A study of blade-vortex interaction aeroacoustics utilizing an independently generated vortex - 2

Acoustic design of rotor blades using a genetic algorithm - 3

Aeroacoustic calculation of helicopter rotors at DLR - 371

Aerodynamics and Aeroacoustics of Rotorcraft - 1

Calculation of high-speed noise from helicopter rotor using different descriptions of quadrupole source - 371

Effect of higher harmonic control on helicopter rotor blade-vortex interaction noise: Prediction and initial validation - 2

Effect of individual blade control on noise radiation - 2

External noise of single rotor helicopters - 370

Initial results from the higher harmonic control aeroacoustic rotor test (HART) in the German-Dutch wind tunnel - 370

The role and status of Euler solvers in impulsive rotor noise computations - 3

The use of Kirchhoff's method in rotorcraft aeroacoustics - 371

Wind tunnel flutter testing on shingles in the transonic and supersonic speed regime - 11

AEROASSIST

Aeroassist Key to Returning From Space and the Case for AFE - 153

Rarefied Flows of Planetary Entry Capsules - 19

AEROBRAKING

Entry and Vehicle Design Considerations - 152

AEROCAPTURE

Entry and Vehicle Design Considerations - 152

AERODYNAMIC BALANCE

Cryogenic Internal Balance Calibration at ETW - 137

AERODYNAMIC CHARACTERISTICS

A preliminary study of the air data sensing problem on a re-entry vehicle - 152

Active Control of Aeromechanical Stability - 127

Aerodynamic Design of Nozzles for Subsonic and Transonic Wind Tunnels - 143

Aerodynamics of 3-D aircraft afterbodies - 3

Aerodynamics of Fuselage and Store-Carriage Interaction Using CFD - 240

Aerodynamics of the ARMOR X7 UAV - 18

Boundary Layer and Loss Studies on Highly Loaded Turbine Cascade - 105

Carriage and Release Aerodynamics of the Pegasus (R) Air-Launched Space Booster - 70

Control and Mathematical Model of Transonic Wind Tunnels - 139

Cryogenic Internal Balance Calibration at ETW - 137

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

Development of High Speed Interferometry Imaging and Analysis Techniques for Compressible Dynamic Stall - 24
Dynamic stall control by variable airfoil camber - 8
Dynamic stall simulation applied to vertical-axis wind turbines - 9
Effect of turbulence modeling on dynamic stall computations - 8
Evaluation of aerodynamic and dynamic models of the rotors of helicopters by confrontation to the experiment - 10
Present capabilities of predicting two-dimensional dynamic stall - 59
Rotating Stall in Turbojet Engine Compressors - 109
Stall hysteresis and 3D effects on stall regulated wind turbines: Experiment and modelling - 9
Surge and Stall Characteristics of Axial-Centrifugal Compressors: The Enhancement to Engine Stability - 110
X-31: A program overview and flight test status - 59

AERODYNAMICS

Advanced Aerodynamic Measurement Technology - 7

Advanced Measurement Technology at NASA Langley Research Center - 265
Advances in Aerodynamic Holography - 265
Advances in Cryogenic Wind Tunnel Technology - 134
Advances in Flight Testing - 6
Aerodynamic Design of a Civil-Aeronautical Low Speed Large Wind Tunnel - 138
Aerodynamics of Store Integration and Separation - 69
Aerothermodynamic Requirements and Design of the Huygens Probe - 20
An Advanced Numerical Scheme for Computational Electromagnetics - 229
An Empirical Correction Method for Improving Off-Axes Response Prediction in Component Type Flight Mechanics Helicopter Models - 81
Analysis of Complex Flow Fields by Animation of PIV and High Resolution Unsteady Pressure Data - 256
Application of Optical and Interference Methods in Experimental Aerodynamics - 374
Capsule Aerothermodynamics - 19
Capsule Aerothermodynamics: Missions, Critical Issues Overview and Course Roadmap - 19
Development of Boeing Research Aerodynamic Icing Tunnel Circuit - 139
ETW Aerodynamic Design: A Case Study - 139
External Hypersonic Aerodynamics: State-of-the-Art and Future Perspective - 20
Future Aerospace Technology in the Service of the Alliance - 5
Low-Speed Flow Studies Using the Pressure Sensitive Paint Technique - 25
Measurement Techniques Developed for Cryogenic Field in T2 Transonic Wind Tunnel - 145
MEMS Applications in Aerodynamic Measurement Technology - 25
Recent Developments in Doppler Global Velocimetry - 256
Separation of lifting vehicles at hypersonic speed wind tunnel tests and flight dynamics simulation - 11
Study Result for the Application of Two-Component PSP Technology to Aerodynamic Experiment - 24
Surface Forces Measurements with High Spatial and Temporal Resolution by Means of Liquid Crystal Foils, Piezofoils and Surface Hot-Film Arrays - 258
The Use of Aircraft Wakes to Achieve Power Reductions in Formation Flight - 76

AEROELASTICITY

A historical overview of flight flutter testing - 64
A unified unsteady aerodynamic module for aeroelastic and MDO applications - 24
Adaptive-Wall Perforated Test Section for Transonic Wind Tunnels - 140
Advances in Cryogenic Wind Tunnel Technology - 134
Aeroelastic pilot-in-the-loop oscillations - 28
Aeroelastic testing of an unmanned air vehicle - 65
Aeroelasticity and C.F.D. - 22
Analysis of rotor forces in a ship airwake - 60
Application of linearized Euler Equations to the estimation of flotation - 22
Application of the ENS3DAE Euler/Navier-Stokes Aeroelastic method - 22
Automated Structural Analysis Process at Rockwell - 75
Calculated viscous and scale effects on transonic aeroelasticity - 22
Design and testing of an aeroelastically scaled model structure - 65

Evaluation of aerodynamic and dynamic models of the rotors of helicopters by confrontation to the experiment - 10
Fast staggered algorithms for the solution of three-dimensional nonlinear aeroelastic problems - 350
Flutter flight test of the RANGER 2000 aircraft - 64
High performance simulation of coupled nonlinear transient aeroelastic problems - 352
Investigation of the yawed operation of wind turbines by means of a vortex particle method - 9
NLR-TU Delft experience in unsteady aerodynamics and aeroelastic simulation applications - 23
Numerical Unsteady Aerodynamic and Aeroelastic Simulation - 7
Stall hysteresis and 3D effects on stall regulated wind turbines: Experiment and modelling - 9
Status on STRATO 2C flight flutter testing activities - 64
The Benefits of the Passive and Active Aeroelastic Design of Aircraft Structures - 90
Transonic aeroelastic simulation of a flexible wing section - 23

AEROMANEUVERING

Aeroassist Key to Returning From Space and the Case for AFE - 153

AERONAUTICS

Index of AGARD publications: 1992-1994 - 382

AEROSERVOELASTICITY

A quarter century of NASA wind-tunnel and flight experiments involving aeroservoelasticity - 11
Advanced aeroservoelastic testing and data analysis - 64
Aeroservoelastic design, test verification and clearance of an advanced flight control system - 126
Experience with unsteady aerodynamics computation for Saab Aircraft - 24
Ground structural coupling testing and model updating in the aeroservoelastic qualification of combat aircraft - 67
High incidence unsteady aerodynamics for aeroservoelastic predictions - 23
Parameter estimation methods for flight flutter testing - 65
System of aeroservoelastic experimental and numerical investigations for aircraft design and certification - 66

AEROSOLS

Aerosol maps made during MAPTIP - 292
Aerosol profiles near the sea surface during MAPTIP - 292
An Overview of EOPACE (Electrooptical Propagation Assessment in Coastal Environments), Including In Situ and Remote Sensing Techniques - 283
Assessment of NAM, the navy aerosol model, for visibility determinations in inland seas such as the Persian Gulf - 219
Characterisation of atmospheric properties during MAPTIP - 291
IR/RF refractivity profiles over coastal water - 203
MAPTIP: Canada's measurements of refraction effects - 201
Micron-sized droplets irradiated with a pulsed carbon dioxide laser: Measurement of explosion and breakdown thresholds - 239
Multispectral Remote Sensing of the Coastal Atmospheric Boundary Layer - 292
Summary of the Marine Aerosol Properties and Thermal Imager Performance trial (MAPTIP) organized by NATO AC/243 Panel 4/RS.8 on Atmospheric Propagation Effects on Electro-Optical Systems, 11 October - 5 November 1993 - 293

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Surface layer turbulence and aerosol profiles during MAPTIP - 292

AEROSPACE ENGINEERING

Advanced Measurement Technology at NASA Langley Research Center - 265

Aerospace 2020, 5, 7, 145, 146 - 366

ATM as Part of the Aerospace Engineering Curriculum - 50

Case Studies of Applications of Turbulence Models in Aerospace - 249

Future Space Transportation Systems and their Potential Contribution to the NATO Mission - 147

Index of AGARD publications: 1992-1994 - 382

Pilot Induced Oscillations - 26

Smart Structures and Materials in Aerospace Applications of Next Generation - 96

Space systems design and development testing - 149

AEROSPACE ENVIRONMENTS

Advanced Architectures for Aerospace Mission Systems - 4

Ground testing and simulation assessment of space environment hazards - 152

NASA technology flight experiments program - 151

Tests of engines have stationary plasma in simulated space environment - 153

Transient Vision Loss in Aircrew - 299

AEROSPACE INDUSTRY

CFD Research in the Changing US Aeronautical Industry - 242

Environmentally Compliant Surface Treatments of Materials for Aerospace Applications - 191

Parallel Computing in Computational Fluid Dynamics - 242

Surface Treatments and the Environment: Impact of Regulations on the Policies of the Aerospace Industries - 291

US Environmental Trends and Issues Affecting Aerospace Manufacturing and Maintenance Technologies - 291

AEROSPACE MEDICINE

A generic specification for Special Purpose Aeromedical Equipment - 58

Advanced Hybrid Oxygen System-Medical - 313

Aeromedical impact of the transportable pressure ventilator in wartime aeromedical evacuation - 332

Aeromedical Support Issues in Contingency Operations - 307

Air Evacuation Under High-Level Biosafety Containment: The Aeromedical Isolation Team - 315

Aircraft Fire Safety - 31

An Integrated Medical Monitor for Aeromedical Use - 312

Audio Effectiveness in Aviation - 224

Aviation Pathology - 306

Aviation Pathology Notes - 307

Aviation Physiology Training in the 21st Century - 329

Carbohydrate Deficient Transferrin: A New Marker to Evaluate Alcohol Consumption in Pilots - 299

Care in the air: A system analysis of clinical outcomes in aeromedical evacuation - 333

CogScreen-Aeromedical Edition in the Assessment of the Head Injured Military Aviator - 298

Current Concepts on G-Protection Research and Development - 334

Early Starts: Effects on Sleep, Alertness and Vigilance - 308

Echocardiography in NATO Aircrew: A Multi-National Study - 301

Evasive Maneuvers and High-G Flight Safety After Sleep Deprivation - 308

Fatigue and Performance in the Air Traffic Control Environment - 324

Fatigue: Operational and Clinical Issues - 323

G-protection basis/acceleration physiology - 334

G-protection capabilities and current G-protection issues - 334

Head Injuries in Military Pilots - 298

Improved Speech Intelligibility in Aircraft Noise due to Altitude - 226

Increase of High-sustained +G(z) tolerance at the expense of pilot's working posture change - 295

Medical Screening of Subjects for Acceleration and Positive Pressure Breathing - 301

Methods for measuring physiological responses and protection in man exposed to high +G(z) - 296

Negative to positive Gz acceleration transition - 295

Neurological Limitations of Aircraft Operations: Human Performance Implications - 297

New advances in physiological measurements during high-G: Technology - 296

On the Composition of Combustion Gases Occurring after Flight Accidents and Incidents and their Analytical Proof of Existence - 161

Operational Determinants of Medical Planning - 311

Optic Nerve Head Drusen: An Example of Aeromedical Decisions Regarding Visual Field Loss - 299

Physiological Vestibular Limitations of Motion Perception in Aviation Environment - 296

Positive pressure breathing for G protection (PBG) - 334

Pros and Cons of Strategic Napping on Long Haul Flights - 308

Psychophysiological Readiness and Sustainability - 331

Reaction Time and the EEG Under Hyperventilation - 296

Rest Management and the Development of Signs of Fatigue in Pilots According to Work Shifts - 308

Seizure Associated With G-LOC: A Potentially Fatal Occurrence - 297

Selection and special physiological training of flying personnel to high +G(z)-maneuverable flights-main concept - 316

Selection and Training Advances in Aviation - 326

Selection of Future Fighter Pilots - 327

Sleepiness During an Accurate Night Shift: Neurophysiological Correlates and Effects on Performance - 323

StatRad: A Portable Imaging Center for Remote/Hostile Environments - 315

Sustained Air Operations: Prolonged Duty Overnight - 307

The Audio Environment in Aircraft - 224

The Flight Orientation Trainer as a Dual Purpose Device: Training Versus Aeromedical Research - 134

The Prevention of Aircraft Accidents Through the Collection and Analysis of Human Factor/Aeromedical Aircraft Accident Data - 36

AEROSPACE SYSTEMS

A technical management structure for the evolution of tactical aerospace C3I systems - 204

Adaptive Interference Cancellation as a Means of Coping with the Complexity of the Target Array and the Platform Environment in Modern and Future Communications Electronic Warfare Systems - 206

An overview of DOD test requirements for launch and space systems - 149

Environmental Factors in Electronic Warfare Related to Aerospace Systems - 206

Future Aerospace Technology in the Service of the Alliance - 6

Future Space Transportation Systems and their Potential Contribution to the NATO Mission - 147

High Performance Data Link for Unmanned Air-Vehicles - 224

Knowledge-Based Functions in Aerospace Systems - 353

NASA technology flight experiments program - 151

S2000+ or preliminary design of space systems - 377

Space Systems as Contributors to the NATO Defence Mission - 145

Space systems design and development testing - 149

Structural Health Monitoring of Aircraft Components - 73

The Ionospheric Factor: Effects and Mitigation in RF Navigation, Surveillance and Communication - 206

The Shape of Things to Come: Revolution in Engineering Anthropometry - 341

Tribology for Aerospace Systems - 269

AEROSPACE VEHICLES

Advanced Measurement Technology at NASA Langley Research Center - 265

Aeroassist Key to Returning From Space and the Case for AFE - 153

Data Base for CFD Validation - 19

Rarefied Flow - 263

AEROSPIKE ENGINES

Multidisciplinary Optimization Methods for Preliminary Design - 89

AEROTHERMOCHEMISTRY

On the Aerothermochemistry of Recirculating Premixed Flames With and Without Swirl - 161

AEROTHERMODYNAMICS

Advanced Measurement Technology at NASA Langley Research Center - 265

Aerothermal Characteristics of Shock/Shock Interaction Regions in Hypersonic Flows - 20

Aerothermodynamic Requirements and Design of the Huygens Probe - 20

Aerothermodynamic testing requirements for future space transportation systems - 150

Aerothermodynamics and Propulsion Integration for Hypersonic Vehicles - 3

Aerothermodynamics and Propulsion Integration: Synthesis of the AGARD-FDP-VKI Special Course, April 15-19, 1996 - 21

Aerothermodynamics of Radiation-Cooled Surfaces - 376

Capsule Aerothermodynamics - 19

Capsule Aerothermodynamics: Missions, Critical Issues Overview and Course Roadmap - 19

Configurational Aerothermodynamics of RAM and SCRAM Propelled Vehicles - 376

Entry and Vehicle Design Considerations - 152

Heat Transfer for Perfect Gas and Chemically Reacting Flows - 249

Hypersonic Aerothermodynamics at VKI - 12

Missile Aerothermodynamics and Propulsion Integration - 376

NASA and ESA Ground Facility Simulations of Shuttle Orbiter Aerothermodynamics - 144

Planetary Atmospheres, Basic Thermodynamics and Regimes - 387

Radiative Heat Flux: Theoretical and Experimental Predictions for Titan Entry Probe - 20

Rarefied Flows of Planetary Entry Capsules - 19
 Real Gas: CFD Prediction Methodology Flow Physics for Entry Capsule Mission Scenarios - 19
 Real Gas/Blunt Cone - 263
 Scientific Barriers to Hypersonic Vehicle Design - 89
 Scramjet Performance Analysis as a Function of Combustion Process Parameters - 114
 Stage Separation Aerothermodynamics - 377
 Survey of Aerothermodynamics Facilities Useful for the Design of Hypersonic Vehicles Using Air-Breathing Propulsion - 144
 The Technology Development and Verification Concept of the German Hypersonics Technology Programme - 13
 Vehicle Configurations and Aerothermodynamic Challenges - 88
 Viscous/Inviscid and Real-Gas Effects Associated with Hypersonic Vehicles - 248

AFTERBODIES

Aerodynamics of 3-D aircraft afterbodies - 3
 Aerothermodynamics and Propulsion Integration: Synthesis of the AGARD-FDP-VKI Special Course, April 15-19, 1996 - 21
 Data Base for CFD Validation - 19
 Inlet and Propulsion Integration of RAM Propelled Vehicles - 118

AFTERBURNING

Active Combustion Control for Propulsion Systems - 161
 The impact of space rocket launches on the earth ozone layer - 289

AGING (BIOLOGY)

Ageing Aircraft - 96
 Ageing Engines - 120

AGING (MATERIALS)

Ageing Aircraft: Managing the Tornado Fleet - 86
 Ageing and Life Prediction of Composite Propellant Motors - 179
 Ageing Behaviour of Composite Propellants - 179
 Ageing Behaviour of Propellants Determined by Mass Loss, Heat Generation, Stabilizer Consumption and Molar Mass Decrease - 182
 Aging Combat Aircraft Fleets: Long Term Applications - 86
 Aging Studies on HTPB Propellants by Dynamic Mechanical Analysis - 184
 Canadian CF-18 Structural Life Management Program - 86
 Characteristics and Determination of the Aging of Solid Propellants - 179
 Characterization of the Degradation of the Polymer Binder in GAP-Based Propellants - 180
 Chemical Safe Life Predictions for Cast Double Base Rocket Propellants - 185
 Coral Reach: USAF KC-135 Aging Aircraft Program - 86
 Correlation Between Stability Results of Gun Propellants Obtained After Artificial Ageing at 50 C and Natural Ageing - 182
 Development of Methods for Aging and Analyzing Propellants Containing Nitrate Ester Stabilized With MNA and 2-NDPA - 178
 Durability and Damage Tolerance - 87
 Effect of loading direction and long-term aging on fatigue-crack growth in Al-Li alloy 2090 - 163
 Evaluation of the Service Life of Tactical Motors - 185
 General Program for Testing Aging: Application to an Air-Sol Missile - 186
 Instrumented Service Life Program for the Pictor Rocket Motor - 183

LOVA Propellant Aging: Effect of Residual Solvent - 182

Methods and Kinetic Models for the Lifetime Assessment of Solid Propellants - 179

Oklahoma City air logistics center (USAF) aging aircraft corrosion program - 1

Prediction of the Shelf Life of Munitions: Ballistic and Chemical Properties - 185

Problems of predicting material property retention during long term service - 274

Repair/Refurbishment of Military Aircraft - 87

Service Life Determination of Rocket Motors by Comprehensive Property Analysis of Propellant Grains - 185

Service Life of Solid Propellant Systems - 178

Solid Rocket Motor Service Life Prediction Using Nonlinear Viscoelastic Analysis and a Probabilistic Approach - 184

Structural Service Lifetime Modelling for Solid Propellant Rocket Motors - 184

The Penetrometer: Non-Destructive Testing of Composite Propellant Rocket Motor Grains to Determine Ageing Characteristics - 180

The Role of NDE in Service Life Prediction of Solid Rocket Propellant - 181

USAF Aging Aircraft Program - 86

AGITATION

Vocal Agitation as a Predictor of Emotion and Stress - 226

AGRICULTURE

Eco-Climatic Classifications by Use of NOAA-AVHRR Data: A Case Study: Tuscany (Central Italy) - 290

AH-64 HELICOPTER

An Empirical Correction Method for Improving Off-Axes Response Prediction in Component Type Flight Mechanics Helicopter Models - 81

The AH-64D Apache Longbow Weapons System - 83

Yaw Motion Cues in Helicopter Simulation - 325

AIR BAG RESTRAINT DEVICES

Inflatable Restraint Systems for Reducing Head Injury - 340

Simulations of Head Strikes in Helicopters and the Roles of Restraints, Seat Stroke and Airbags on their Reduction - 340

AIR BREATHING ENGINES

Aerothermodynamics and Propulsion Integration: Synthesis of the AGARD-FDP-VKI Special Course, April 15-19, 1996 - 21

Combined-Cycle Engines for Hypersonic Applications - 114

Evaluation of an Ejector Ramjet Based Propulsion System for Air-Breathing Hypersonic Flight - 118

Flight Testing for Hypersonic Speeds: An European View - 88

Flight testing vehicles for verification and validation of hypersonics technology - 147

Future Aerospace Technology in the Service of the Alliance - 5

Hypersonic Air-Breathing Missile Propulsion - 118

Overview of Propulsion Performance - 119

Propulsion and Energy Issues for the 21st Century - 272

Scramjet and Dual Mode Ramjets - 118

Scramjet Engine/Airframe Integration Methodology - 89

Survey of Aerothermodynamics Facilities Useful for the Design of Hypersonic Vehicles Using Air-Breathing Propulsion - 144

Systems Challenges for Hypersonic Vehicles - 89

AIR DATA SYSTEMS

A preliminary study of the air data sensing problem on a re-entry vehicle - 152

Shuttle orbiter experiments: Use of an operational vehicle for advancement and validation of space systems design technologies - 152

AIR DEFENSE

Adaptive strike planning with search path allocation - 361

Air Defence Radar Surveillance System Tracking Assessment - 223

Air Force C3I architecture concepts - 204

Aircraft Design Integration and Affordability - 94

An integrated system for air to ground operations - 360

Application of Multiple Hypothesis Tracking to Multi-Radar Air Defense Systems - 222

Decision tool for optimal deployment of radar systems - 205

Electronic combat and lethal defense suppression - 194

Guidance and Control for Future Air-Defence Systems - 186

Helicopter HF communications using the NVIS mode - 194

Some Thoughts on the Military Missions and Operational Scenarios Regarding Hypersonic Vehicles - 367

SOSIE: A pragmatic approach to the simulation of Broad Air Defense applied to the theater level - 187

Study of Extended Air Defence Post 2000 - 186

Unmanned Tactical Air Vehicles: An Electronic Combat Perspective - 369

AIR DUCTS

Self-Oscillation Flow Control in Free-Jet Wind Tunnels - 142

AIR FLOW

Analysis of rotor forces in a ship airwake - 60

Development of Close-Circuit Subsonic Wind Tunnel with Diametral Fan - 142

Investigation into effect produced by blade airfoil unsteady airflow on helicopter main rotor power required - 8

Rotational and Vibrational Temperatures and Density Measurements by Coherent Anti-Stokes Raman Scattering in a Nonequilibrium Shock Layer Flow - 257

Ship Airwakes: A New Generic Model for Piloted Simulation - 131

AIR INTAKES

Air Intake and Air Intake / Combustion Interaction - 89

Inlet and Propulsion Integration of RAM Propelled Vehicles - 118

Inlet and Propulsion Integration of Scram Propelled Vehicles - 118

AIR LAUNCHING

Carriage and Release Aerodynamics of the Pegasus (R) Air-Launched Space Booster - 70

Pegasus air-launched space booster flight test program - 150

AIR MASSES

A microwave propagation model coupled to an air mass transformation model - 203

Alleviation of Axial Static Pressure Gradients in 2D Perforated Test Section of IAR Blowdown Wind Tunnel - 140

Synoptic Variability Revealed by Satellite and Equivalent Altitude - 286

AIR NAVIGATION

A tactical navigation and routing system for low-level flight - 360

Aerospace navigation systems - 39

Aerospace navigation systems requirements for fixed wing aircraft - 97

An overview of a generic multi-sensor integrated navigation system design - 40

Autopilot Synthesis for Unmanned Tactical Air Vehicles (UTAV) - 129

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

Remote measurement of atmospheric refraction conditions in the coastal region - 291

Surface layer turbulence and aerosol profiles during MAPTIP - 292

Using Remote Refractivity to Predict Tropospheric Refractivity from Measurements of Microwave Propagation - 218

AIRBORNE EQUIPMENT

A Data Acquisition System for the RNLA F-16 Requirements and Proposal - 102

Airborne Dual Sensor Millimeter Wave-Signatures of Maritime Targets and Sea-Clutter - 288

Airborne System Detection and Localization of Radio Interference Sources - 219

An Algorithm for Ship Temperature Retrieval from Airborne Infrared Radiometric Measurements - 285

Characteristics and Determination of the Aging of Solid Propellants - 179

Helicopter HF communications using the NVIS mode - 194

Helicopter Task Force: A Mission Effective Solution for Precision Air Strikes - 361

Pixel Fusion for Roads Detection and Classification - 385

Remote measurement of atmospheric refraction conditions in the coastal region - 291

Remote Sensing by Active and Passive Optical Techniques - 283

Virtual Environments: Visualization Throughout the Combat Mission - 367

VLSI Implementation of a Chip for a Systolic Array Architecture for Direction Finding Systems - 239

AIRBORNE LASERS

Development of a Wideband Airborne Laser Data Link - 269

AIRBORNE RADAR

Diffusion of Microwaves by Non-Spherical and Inhomogeneous Hydrometers: Simulations, Observations, and Restorations during the TOGA-COARE Experiment - 283

Electronic Countermeasures against Synthetic Aperture Radars - 219

Imaging Tools for Spaceborne SAR Programme - 282

Introduction to Avionics Flight Test - 97

MM-Wave Airborne Cloud Radars - 218

SAR Measurements of Extended Targets at 94 GHz - 286

SAR Systems and Related Signal Processing - 282

SARAP: A Tool for Radar Clutter Measurement - 282

Spaceborne SAR simulation using airborne data - 199

Summary of the Marine Aerosol Properties and Thermal Imager Performance trial (MAPTIP) organized by NATO AG/243 Panel 4/RSG.8 on Atmospheric Propagation Effects on Electro-Optical Systems, 11 October - 5 November 1993 - 293

AIRBORNE SURVEILLANCE RADAR

Multisensor data fusion for integrated maritime surveillance - 193

AIRBORNE/SPACEBORNE COMPUTERS

Flight flutter testing of combat aircraft - 66

Model following control for tailoring handling qualities: ACT experience with ATTHes - 123

Use of simulation tools and facilities for Rendez-Vous and Docking missions - 151

AIRCRAFT

Comparative Evaluation of the Lifetime of Composite and Simple Base Propellants - 182

Study Result for the Application of Two-Component PSP Technology to Aerodynamic Experiment - 24

AIRCRAFT ACCIDENT INVESTIGATION

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications - 306

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications: General Concepts and Objectives - 37

AIRCRAFT ACCIDENTS

A Computer-Based Simulation and Risk Assessment Model for Investigation of Airliner Fire Safety - 32

A Review of Fire Related Accidents, 1985-1995 - 31

A Review of Recent Civil Air Transport Accidents/Incidents and their Fire Safety Implications - 31

Aircraft Post Crash Management: The Royal Air Force Approach - 32

Applications of Physical Analysis and Crash Survivability - 306

Aviation Pathology - 306

Aviation Pathology Notes - 307

Cause of Death: Fire or Trauma? - 36

Head Injury Risk in US Army Rotary-Wing Mishaps: Changes Since 1980 - 339

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications - 306

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications: General Concepts and Objectives - 37

On the Composition of Combustion Gases Occurring after Flight Accidents and Incidents and their Analytical Proof of Existence - 161

Post-Crash Fire Hazards Research - 32

Principles of Crash Survivability - 306

SAAB experience with PIO - 28

Seizure Associated With G-LOC: A Potentially Fatal Occurrence - 297

Surviving a Helicopter Ditching: An Engineering challenge - 36

The Flight Safety Officer's Perspective - 29

The Physical Basis of Impact Injury and Its Prevention - 306

The Prevention of Aircraft Accidents Through the Collection and Analysis of Human Factor/Aeromedical Aircraft Accident Data - 36

The relation of handling qualities ratings to aircraft safety - 27

The Role of Evacuation Modelling in the Development of Safer Air Travel - 330

AIRCRAFT APPROACH SPACING

Design principles and algorithms for automated air traffic management - 42

AIRCRAFT CARRIERS

Analysis of rotor forces in a ship airwake - 60

Enhancing Neurological Performance in Naval Aerospace USS Carrier Ground and Support Operations: Practical Challenges - 324

AIRCRAFT COMMUNICATION

Effects of Active Noise Reduction on Noise Levels at the Tympanic Membrane - 302

AIRCRAFT COMPARTMENTS

Burnthrough Resistance of Fuselage and Cabin Structures - 35

Description and Status of Civil Aviation's Halon Replacement Program - 33

Effects of Helicopter Cabin Noise Upon HF Vocoder Secure Speech Systems - 226

Extinguishing of Aircraft Interior Fires with Halon Replacements for Handheld Extinguishers - 33

Halon Replacement: Aviation Test Criteria - 33

In-Flight Measurements and Prediction of Internal Noise of ECUREUIL Helicopter - 81

Interior Conditioning in Military Transport: Aircraft Certification - 34

New Fire Safe Material for Cabin Interiors - 35

Numerical Simulations of Aircraft Cabin Fire Suppression - 32

Toxicity of Combustion Products in Materials used for Cabin Fixtures: A Simplified Method of Evaluation - 35

Using Mathematical Models to Predict the Development of Aircraft Cabin Fires - 32

AIRCRAFT CONFIGURATIONS

Aging Combat Aircraft Fleets: Long Term Applications - 86

Airborne Dual Sensor Millimeter Wave-Signatures of Maritime Targets and Sea-Clutter - 288

Configurational Aerothermodynamics of RAM and SCRAM Propelled Vehicles - 376

Flight test of a low-altitude helicopter guidance system with obstacle avoidance capability - 37

High Fidelity, Mobile, Net Workable Trainers: The Trainers of the Future? - 133

Integrated Flight and Propulsion Controls for Advanced Aircraft Configurations - 117

Low-Level and Nap-of-the-Earth (NOE) night operations - 28

Parametric Identification of Transonic Unsteady Flow Characteristics for Predicting Flutter of Fighter Aircraft With External Stores - 126

Surviving a Helicopter Ditching: An Engineering challenge - 36

Unconstrained Maneuver Air Vehicle: A Configuration Development - 94

AIRCRAFT CONSTRUCTION MATERIALS

Advanced Polymeric & Metallic Composite Materials for Space and Aerospace Vehicle Structures and Strength Optimization of Composite Structures and their Certification - 155

Crash Resistant Composite Subfloor Structures for Helicopters - 80

GLARE(R): A structural material for Fire Resistant Aircraft Fuselages - 35

Introduction of Beryllium Aluminum Castings in the RAH-66 Comanche EOSS Program - 81

Metallic and Non-Metallic Protection Systems for Reduction of Tribologic Influences in Several Areas on Tornado Aircraft - 167

Model 412 Composite Tailboom - 80

New Fire Safe Material for Cabin Interiors - 35

Test method and test results for environmental assessment of aircraft materials - 163

Titanium Fire in Jet Engines - 35

Toxicity of Combustion Products in Materials used for Cabin Fixtures: A Simplified Method of Evaluation - 35

Adhesively bonded composite patch repair of cracked aluminum alloy structures - 54

Aging Combat Aircraft Fleets: Long Term Applications - 86

Aircraft Dissection: A Guide for Military & Civilian Air Carriers - 29

Avoiding WFD: A guide to the fatigue design regulations for British military aircraft - 62

Bonded composite repair of metallic aircraft components: Overview of Australian activities - 53

Bonded composite repair of thin metallic materials: Variable load amplitude and temperature cycling effects - 54

Composite or metallic bolted repairs on self-stiffened carbon wing panel of the commuter ATR72 design criteria, analysis, verification by test - 57

Composite repair issues on the CF-18 aircraft - 56

Composite repair of a CF18: Vertical stabilizer leading edge - 56

Composite repair of composite structures - 56

Composite repair of metallic airframe: Twenty years of experience - 54

Composite Repair of Military Aircraft Structures - 53

Damage occurrence on composites during testing and fleet service: Repair of Airbus aircraft - 57

Design and structural validation of CF116 upper wing skin boron doubler - 54

Environmentally Safe and Effective Processes for Paint Removal - 188

Evaluation of patch effectiveness in repairing aircraft components - 55

Experiences In Maintenance and Overhaul of Military Aircraft - 4

External patch repair of CFRP/honeycomb sandwich - 57

Field repair materials for naval aircraft - 55

Maintenance-Free Aircraft - 96

On aircraft repair verification of a fighter A/C integrally stiffened fuselage skin - 55

POD assessment of NDI procedures using a round robin test - 274

Process evaluation - 190

Quality Assurance and Certification Procedures for Bonded Joints In On-Aircraft Scenarios - 275

Rapid repair of large area damage to contoured aircraft structures - 56

Reducing Maintenance Costs for Combat Aircraft Air Frames - 6

Reliability and maintainability - 58

Repair of high temperature composite aircraft structure - 56

Repair technology for thermoplastic aircraft structures - 56

Repair/Refurbishment of Military Aircraft - 87

Repairs of CFC primary structures - 58

Risk analysis in the presence of corrosion damage - 62

Risk assessment of an aging military trainer aircraft - 62

Royal Air Force Experience of Mechanically-Fastened Repairs to Composite Aircraft Structures - 4

Scar joint technique with cocured and precured patches for composite repair - 57

Standardization work - 190

Statistical property of widespread fatigue damage - 274

Status of bonded boron/epoxy doublers for military and commercial aircraft structures - 54

Structural Health Monitoring of Aircraft Components - 73

Structural modification and repair of C-130 wing structure using bonded composites - 55

The development of an engineering standard for composite repairs - 58

Widespread fatigue damage and single member failure prediction of military jet trainers of Czech design and production - 61

Widespread Fatigue Damage in Military Aircraft - 61

AIRCRAFT MANEUVERS

Carrier Phase GPS Time, Space, Position Information Demonstration (CAPTIDE) - 46

Conduct of the Aircraft: Flight Dynamics - 37

Determination and Verification of Operational Maneuver Parameters and Time Histories - 84

Eurofighter 2000 Structural Design Criteria and Design Loading Assumptions - 85

Evaluation of loads from operational flight maneuvers - 72

Evasive Maneuvers and High-G Flight Safety After Sleep Deprivation - 308

Flight Loads Derived from Operational Maneuvers - 84

Multifunction Millimetre Wave Radar for Future Military Navigation - 208

Negative to positive Gz acceleration transition - 295

AIRCRAFT MODELS

Adaptive-Wall Perforated Test Section for Transonic Wind Tunnels - 140

An Empirical Correction Method for Improving Off-Axes Response Prediction in Component Type Flight Mechanics Helicopter Models - 81

Application of Neural Network to Reconfiguration of Damaged Aircraft - 354

Flow Field Survey In Trailing Vortex System Behind a Civil Aircraft Model at High Lift - 16

In-Flight Measurements and Prediction of Internal Noise of ECUREUIL Helicopter - 81

Instrumentation for Cryogenic Tunnels - 135

Investigation of buffet load alleviation on a scaled F-15 twin tail model - 128

Model Deformation Measurements at NASA Langley Research Center - 25

NLR-TUDELft experience in unsteady aerodynamics and aeroelastic simulation applications - 23

The Aerodynamic and Structural Design of the DRA 5-Metre and ONERA F1 Low-Speed Pressurised Wind Tunnels - 138

The Two-Component PSP Investigation on a Civil Aircraft Model in S2MA Wind Tunnel - 25

Use of Virtual Prototyping In Design and Manufacturing - 347

AIRCRAFT NOISE

Adaptive Active Noise Reduction Headset for Helicopter Aircrew - 338

Aircraft Noise Profiles and the Efficiency of Noise Protection Devices in the Royal Danish Air Force - 339

Audio Effectiveness in Aviation - 224

Effects of Helicopter Cabin Noise Upon HF Vocoder Secure Speech Systems - 226

Improved Speech Intelligibility in Aircraft Noise due to Altitude - 226

Reduction of the Noise Signature of the Eurocopter EC 135 - 372

The Audio Environment in Aircraft - 224

Vocal Agitation as a Predictor of Emotion and Stress - 226

Vulnerability of Female Speech Produced in Operational Noises - 226

MAPTIP: Canada's measurements of refraction effects - 201

Mesoscale modeling of refractive conditions in a complex coastal environment - 203

Modeling nonperfect reflection from the sea for range-dependent ducting conditions - 200

Modeling the vertical profiles of the Index of refraction and $C(\text{sub } n)(\text{exp } 2)$ in marine atmosphere - 201

Overview of NATO/AC 243/Panel 3 activities concerning radiowave propagation in coastal environments - 201

Propagation Assessment in Coastal Environments - 199

Refraction effects on EO system detection ranges in coastal environments - 200

Refractive variability during VOCAR 23 August to 3 September 1993 - 202

Remote measurement of atmospheric refraction conditions in the coastal region - 291

Structure, variability, and sensing of the coastal environment - 281

Summary of the Marine Aerosol Properties and Thermal Imager Performance trial (MAPTIP) organized by NATO AC/243 Panel 4/RSG.8 on Atmospheric Propagation Effects on Electro-Optical Systems, 11 October - 5 November 1993 - 293

Terrain and refractivity effects in a coastal environment - 199

Use of satellite imagery and other indicators to assess variability and climatology of oceanic elevated ducts - 202

COATING

Advantages/Disadvantages of Various TBC Systems as Perceived by the Engine Manufacturer - 172

Corrosion in service experience with aircraft in France - 164

Corrosion Prevention System for the F-16 Fighter Aircraft - 87

Evaluation of Thermal Barrier Coatings From Burner Rig Tests - 171

Experiences in Maintenance and Overhaul of Military Aircraft - 4

Graded Design of EB-PVD Thermal Barrier Coating Systems - 171

Organic coating technology for the protection of aircraft against corrosion - 166

Visualization and Measurement of Surface Shear Stress Vector Distributions Using Liquid Crystal Coatings - 258

COATINGS

High-Temperature Surface Measurements of Turbine Engine Components Using Thermographic Phosphors - 269

Low-Speed Flow Studies Using the Pressure Sensitive Paint Technique - 25

COAXIAL FLOW

Investigations into sub-ns pulse generation using ferrite-loaded coaxial lines - 238

COBALT ALLOYS

Axial-Torsional, Thermomechanical Fatigue Behavior of Haynes 188 Superalloy - 165

COCKPITS

A Generic Architecture for Crew Assistant Systems - 339

Application of an Anthropometric Tool to Cockpit Layout - 342

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Assessment of Anthropometric Accommodation in Aircraft Cockpits and Pilot Body Size Selection Criteria - 335

Audio Display Technology - 372

Audio Effectiveness in Aviation - 224

Cockpit Technologies Research at the Flight Research Laboratory of the National Research Council of Canada - 82

Cockpit Usability - A Design Checklist - 341

Design Considerations for 3-D Auditory Displays in Cockpits - 224

Development and Evaluation of the AH-1W Supercockpit - 71

Evaluation of a Three-Dimensional Auditory Display in Simulated Flight - 225

Glass Cockpit Operational Effectiveness - 71

Hidden Usability Issues in Speech Interfaces - 227

Integration of Technologies for Closed Cockpits - 342

Loss of Aviation Situation Awareness in the Canadian Forces - 317

Near-Threshold Visual Perception and Manual Alert Tracking: Dual-Task Performance and Implications for Situational Awareness - 318

Perspectives of Crew Assistance in Military Aircraft Through Visualizing, Planning and Decision Aiding Functions - 339

Rapid Targeting and Real-Time Response: The Critical Links for Effective Use of Combined Intelligence Products in Combat Operations - 365

Situation Awareness: Limitations and Enhancement in the Aviation Environment - 317

Situational Awareness Measurement in Cockpit Evaluation Trials - 319

Tactical Cockpits: Flat Panel Imperatives - 97

The Audio Environment in Aircraft - 224

The Dutch National Simulation Facility: Advancements in Simulator Technology and Application - 132

The Effects of Spatial Auditory Preview on Visual Performance - 330

The Use of Piloted Simulation for Civil Tiltrotor Integrated Cockpit Design - 73

Voice Recognition in Adverse Aircraft Cockpit Environments - 226

CODERS

Digital Video Compression for Weapons Control and Bomb Damage Indication - 362

CODING

Optimum Routing: Analytical constraint of search space - 360

COEFFICIENT OF FRICTION

Analysis of Fretting and Fretting Corrosion in Airframe Riveted Connections - 165

Sputter-Deposited Lubricant Thin Films Operating at Elevated Temperatures in Air - 167

COGNITION

Closed Head Injury and the Military Aviator: Assessing Cognitive Dysfunction and Seizure Risk - 305

Cognitive Performance During a 64-Hours Sleep Deprivation: Interest of a Slow Release Caffeine - 310

Modafinil Effects on Spatial Cognition During 60 Hours of Sleep Deprivation - 309

COGNITIVE PSYCHOLOGY

Development of Techniques to Identify Individuals with Superior Potential for Situational Awareness - 318

Situational Awareness in Aerial Combat - 320

Techniques for Computational and Machine Intelligence Soft Computing - 347

COHERENT RADAR

A Modular Scalable Signal Processor Architecture for Radar and EW Applications - 100

Multisensor data fusion for integrated maritime surveillance - 193

COHERENT SCATTERING

Evaluation of Coherence Bandwidth for Long Distance VHF/UHF Transmissions - 212

Rotational and Vibrational Temperatures and Density Measurements by Coherent Anti-Stokes Raman Scattering in a Nonequilibrium Shock Layer Flow - 257

COLD WORKING

Repair/Refurbishment of Military Aircraft - 87

COLLISION AVOIDANCE

A tactical navigation and routing system for low-level flight - 360

Air Traffic Control Procedures for the Avoidance of Wake Vortex Encounters: Today and Future Developments by Deutsche Flugsicherung GmbH - 30

Laser based obstacle warning sensors for helicopters - 29

The Effects of Spatial Auditory Preview on Visual Performance - 330

COLLISIONS

Human Tolerance to Abrupt Acceleration - 306

The Physical Basis of Impact Injury and Its Prevention - 306

COMBAT

A Discussion of a Modular Unmanned Demonstration Air Vehicle - 91

Agility in the Context of Improved Operational Effectiveness - 90

Anaerobic Capacity and Height Relationship to Simulated Air Combat Maneuver (SACM) - Duration - 300

Attentional Control and Situational Awareness in a Complex Air Combat Simulation - 320

Current Neurological Performance Issues in Army Rotary-Wing Operations - 324

Electronic combat and lethal defense suppression - 194

Future Aerospace Technology in the Service of the Alliance - 6

Mission Re-Planning for Standoff Weapons - 369

Overview - 4

Piloted Simulation in Low Altitude, High Speed Mission Training and Rehearsal - 134

RAH-66 Comanche Case History - 83

Rapid Targeting and Real-Time Response: The Critical Links for Effective Use of Combined Intelligence Products in Combat Operations - 365

Situational Awareness in Aerial Combat - 320

Small Effective Air-to-Surface Munitions for Unmanned Tactical Aircraft Applications - 192

SOSIE: A pragmatic approach to the simulation of Broad Air Defense applied to the theater level - 187

Tactical Environment Servers - 345

The Challenge of UAV Supporting Offensive Air Operations - 369

TIGER - 83

Unmanned Tactical Air Vehicles: An Electronic Combat Perspective - 369

Visual Scenes for Battlefield Helicopter Operations: Evaluation of Requirements and How to Specify Them - 325

COMBINATORIAL ANALYSIS

Optimal Scheduling With Maximum Position Shift (MPS) Constraints: A Runway Scheduling Application - 51

Optimum Routing: Analytical constraint of search space - 360

COMBUSTIBLE FLOW

Test Facilities for Basic Research on Propulsion - 119

COMBUSTION

Advanced Non-Intrusive Instrumentation for Propulsion Engines - 192

CARS Diagnostics on Model Gas Turbine Combustor Rigs - 273

Characterization of Gas Turbine Combustion Chambers with Single Pulse CARS Thermometry - 273

Compressible Turbulent Free Shear Layers - 249

Development of Planar Laser Induced Fluorescence for Fuel: Application to Gas Turbine Combustion - 269

Using Mathematical Models to Predict the Development of Aircraft Cabin Fires - 32

COMBUSTION CHAMBERS

Air Intake and Air Intake / Combustion Interaction - 89

CARS Diagnostics on Model Gas Turbine Combustor Rigs - 273

Characterization of Gas Turbine Combustion Chambers with Single Pulse CARS Thermometry - 273

Combined-Cycle Engines for Hypersonic Applications - 114

Critical Physical Phenomena in Scramjet Propulsion - 118

Development of Planar Laser Induced Fluorescence for Fuel: Application to Gas Turbine Combustion - 269

Dynamic Response of a Cryogenic Lox Pump to Pressure and Massflow Fluctuation - 269

On Thick Thermal Barriers for Combustor Application - 169

Preliminary Design and Performance Analysis of a Variable Geometry Recuperative Turboshift - 114

Scramjet Performance Analysis as a Function of Combustion Process Parameters - 114

Test Facilities for Basic Research on Propulsion - 119

The Effect of TBC Utilization in the Design of Robust Aircraft Combustors - 172

Thermal and Mechanical Loading on a Fire Protection Shield due to a Combustor Burn-Through - 34

Thermal Mechanical Fatigue and its Effect on Combustor Design - 104

Time Resolved Measurements of Turbine Blade Flow Phenomena - 261

Using the Laser Light Sheet Technique in Combustion Research - 162

COMBUSTION CHEMISTRY

Possible ways of development of ecologically safe solid rocket propellants - 174

Turbulent Combustion - 160

COMBUSTION CONTROL

Active Combustion Control for Propulsion Systems - 161

COMBUSTION EFFICIENCY

Development of environmentally acceptable propellants - 173

Development of less polluting propellants - 173

Studies on NOx-Emissions of SST Engine Concepts - 114

COMBUSTION PRODUCTS

Emission spectroscopy and pyrometry of propellant flames and solid rocket exhaust products - 153

Evaluation of ammonium nitrate propellant emissions - 175

On the Composition of Combustion Gases Occurring after Flight Accidents and Incidents and their Analytical Proof of Existence - 161

Possible ways of development of ecologically safe solid rocket propellants - 174

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Test rig for solid propellant rocket motors that reduces the impact of noise on the environment - 289

Toxicity Issues in Aircraft Fire Science - 36

Toxicity of Combustion Products in Materials used for Cabin Fixtures: A Simplified Method of Evaluation - 35

COMBUSTION TEMPERATURE

Gas pollutants from ammonium nitrate based propellants - 175

COMMAND AND CONTROL

An integrated theater battle management C2 architecture based on commercially available software - 382

Attenuation of Effects and Multiple Trajectories and Interference in Military Radio Communication by Signal Processing - 213

Communications Realism with Integrated Terrain-Environment-Multipath Model - 217

Coordinated Speech Technology Research of Nine NATO Countries in Research Study Group RSG-10 - 225

Department of Defense Perspective on Open Systems Architecture - 365

Dual Usage in Military and Commercial Technology in Guidance and Control - 190

Guidance and Control for Future Air-Defence Systems - 186

Helicopter Task Force: A Mission Effective Solution for Precision Air Strikes - 361

Horizon: An architecture management and C4I capabilities planning process for the United States Air Force - 204

Longterm aspects of Air Force C3I - 204

Medical Global Command and Control System - 237

Method of Evaluating Performance Level of a Multiple-Sensor Tracking Device - 234

Multi-Sensor Data Fusion in Command and Control and the Merit of Artificial Intelligence - 354

Multi-sensor data fusion in command and control and the merit of artificial intelligence - 352

NATO Alliance Ground Surveillance Interoperability - 367

Operational effectiveness through interoperability - 361

Possible Features of NATO Communications Satellite Gap Filler - 228

SCCOA (Air Operation Conduct and Control System) program: Air Force requirements and its technical development - 204

Study of Extended Air Defence Post 2000 - 186

System-Level Track Fusion for Command and Control - 222

Tactical Aerospace C3I in Coming Years - 204

Technologies for Precision Air Strike Operations in Rapid-Reaction and Localized-Conflict Scenarios - 361

The DLR research programme on an integrated multi sensor system for surface movement guidance and control - 38

COMMAND GUIDANCE

Dual Usage in Military and Commercial Technology in Guidance and Control - 190

Guidance and Control for Future Air-Defence Systems - 186

Low-level data fusion for landing runways detection - 38

ONERA and DLR Cooperation on the Smart Helicopter Concept: Handling Qualities Data Base for Hover and Low Speed Flight - 80

Security of command systems - 205

COMMERCE

Commercial usage of Navy components developed and manufactured by CRI Delfin - 264

Effects of the specific military aspects of satellite navigation on the civil use of GPS/GLONASS - 38

Some results of international cooperation in military to commercial conversion of laser gyro technology - 264

COMMERCIAL AIRCRAFT

A Computer-Based Simulation and Risk Assessment Model for Investigation of Airliner Fire Safety - 32

A Review of Recent Civil Air Transport Accidents/Incidents and their Fire Safety Implications - 31

Addressing Front Row HIC Requirements in Commercial Airplanes - 340

Aircraft Disinsection: A Guide for Military & Civilian Air Carriers - 29

Standardization work - 190

The Boeing 777: A Look Back - 378

Visual and Non-Destructive Inspection Technologies - 275

COMMERCIAL SPACECRAFT

Remote Sensing: A Valuable Source of Information - 281

COMMERCIALIZATION

'COTS': Customization, Opportunities and Trade-Offs - 378

COMMUNICATION

Passive HF Propagation Evaluation Technique - 209

Virtual Environments: Visualization Throughout the Combat Mission - 367

COMMUNICATION CABLES

Application-Specific Bandwidth Compression for Dissemination of Image Data - 228

COMMUNICATION EQUIPMENT

Communications Realism with Integrated Terrain-Environment-Multipath Model - 217

F-16 System/Structural Upgrades - 86

Multifunctional Radio Systems for Multinational Forces - 232

Personal Active Noise Reduction with Integrated Speech Communication Devices: Development and Assessment - 337

COMMUNICATION NETWORKS

Advances in Supporting Technologies - 355

Application-Specific Bandwidth Compression for Dissemination of Image Data - 228

Communications and Situation Awareness on Hostile Borders - 217

Communications and the Global Positioning System - 213

Cost Management Processes for Satellite Communications Systems: Lessons Learned - 378

Integrated Modular Avionics Architecture Concepts Demonstration - 99

Modelling and Simulation of Communication Systems - 233

Multi-Sensor Systems and Data Fusion for Telecommunications, Remote Sensing and Radar - 387

Multifunctional Radio Systems for Multinational Forces - 232

Operational effectiveness through interoperability - 361

The Influence of Antennas and Propagation on the Behavior of HF Digital Communications Links - 217

Turbulence in the Upper Atmosphere: Effects on Systems - 207

COMMUNICATION SATELLITES

Adaptive Interference Cancellation as a Means of Coping with the Complexity of the Target Array and the Platform Environment in Modern and Futura Communications Electronic Warfare Systems - 206

FADS: A demonstrator for MilComSat AOCSS - 150

Multiple UMAs In-Flight Management - 364

Numerical Technologies for a Satellite Telecommunications Antijamming Payload - 228

Possible Features of NATO Communications Satellite Gap Filler - 228

The Evolving NATO Satellite Experience - 146

COMPARISON

Comparison Between Series and Parallel Wave Forms for High Frequency Transmission - 212

COMPARTMENTS

Facilities used for plastic media blasting - 129

COMPASSES

Magnetic heading references - 40

COMPETITION

UK Attack Helicopter Flying Qualities: The Role of Piloted Simulation Evaluation in Supporting the Procurement Decision Making Process - 72

COMPLEX SYSTEMS

Air Force C3I architecture concepts - 204

Case Study Involving FAIT - 343

Global/Local Analysis in Finite Element Technology - 355

Information: The Warfighter's Edge. The Joint Strike Fighter (JSF) and System-of-Systems (SoS) - 365

Introduction to Avionics Flight Test - 97

Scientific Barriers to Hypersonic Vehicle Design - 89

Use of Object Oriented Programming to Simulate Human Behavior in Emergency Evacuation of an Aircraft's Passenger Cabin - 330

COMPONENT RELIABILITY

Developing Affordable Gas Turbine Engines - 113

COMPOSITE MATERIALS

3-D Composites in Primary Aircraft Structure Joints - 159

A FEAM based methodology for analyzing composite patch repairs of metallic structures - 54

A Review of Composite Joint Analysis Programs - 158

Analysis Method for Bolted Composite Joints Subjected to In-Plane Shear Loads - 279

Bolted Joints in Composite Structures: An Overview - 158

Composite repair of composite structures - 56

Damage occurrence on composites during testing and fleet service: Repair of Airbus aircraft - 57

Determination of A- and B-values of strength and fatigue resistance for preforms and elements of composites structural materials - 157

Ensuring composite structure strength - 157

Evaluation of environmentally acceptable cleaners as replacements for methyl ethyl ketone and 1,1,1 trichloroethane in solid rocket motor production and maintenance applications - 178

Model 412 Composite Tailboom - 80

Post-Crash Fire Hazards Research - 32

Rapid repair of large area damage to contoured aircraft structures - 56

Repair of high temperature composite aircraft structure - 56

Royal Air Force Experience of Mechanically-Fastened Repairs to Composite Aircraft Structures - 4

The Application of a Proprietary Sound-Attenuating Technology to Passive Circumaural Hearing Protector Design - 337

The development of an engineering standard for composite repairs - 58

Tiltrotor Transport Bonded Wing Design Summary - 78

Virtual Manufacturing for Composites - 349

Technology Requirement to Implement Improved Situation Awareness: Machine Perception - 355

DECISION THEORY

An original numerical method for autonomous navigation - 353

DECOMPOSITION

Ageing Behaviour of Propellants Determined by Mass Loss, Heat Generation, Stabilizer Consumption and Molar Mass Decrease - 182

DECONTAMINATION

Aircraft Disinsection: A Guide for Military & Civilian Air Carriers - 29

DECOUPLING

Advanced Avionics Architectures: Where are We Going? - 98

DEFECTS

New nondestructive techniques for the detection and quantification of corrosion in aircraft structures - 274

Structural Health Monitoring of Aircraft Components - 73

Thermographic Detection of Bond Defects within Models of Solid Propellant Motors - 180

DEFENSE INDUSTRY

COTS Joins the Military - 85

Reorganisation of Evaluation and research to Support Future Defence Procurement - 381

Strategic Management of the Cost Problem of Future Weapon Systems - 377

Towards Autonomous Unmanned Systems - 355

DEFENSE PROGRAM

Aerospace 2020 - 146

An integrated theater battle management C2 architecture based on commercially available software - 382

Application of Multiple Hypothesis Tracking to Multi-Radar Air Defense Systems - 222

Cost Reduction Strategies in Acquiring Aircraft Weapon Systems at - 382

Definition of an anti-missile ballistic defense architecture for Europe - 187

Department of Defense Perspective on Open Systems Architecture - 365

From Information Warfare to Information Power: A New Paradigm for National Security in the Information Age - 233

Impact of COTS on Military Avionics Architectures - 100

Interpretation of Passive Microwave Radiances for Tactical Applications: Current and Future Capabilities of the Defense Meteorological Satellite Program (DMSP) - 294

DEFLECTION

High incidence unsteady aerodynamics for aero-servoelastic predictions - 23

DEFORMATION

Intrinsic Strength of Solid Propellant Bond Systems: Stress-Strain Behavior Bit-in-Tension with Rubber Materials - 184

Model Deformation Measurements at NASA Langley Research Center - 25

Turbulent Boundary Layer over a Compliant Surface - 251

DEGRADATION

Aircraft Loads and Monitoring - 87

Characterization of the Degradation of the Polymer Binder in GAP-Based Propellants - 180

Chemical Safe Life Predictions for Cast Double Base Rocket Propellants - 185

In-situ detection of surface passivation or activation and of localized corrosion: Experiences and perspectives in aircraft - 163

Non-destructive detection of corrosion for life management - 274

Oklahoma City air logistics center (USAF) aging aircraft corrosion program - 1

The detection and analysis of galvanic damage in BMI/graphite fiber composites - 155

The Role of NDE in Service Life Prediction of Solid Rocket Propellant - 181

Widespread Fatigue Damage in Military Aircraft - 61

DEGREES OF FREEDOM

Achieving High-Fidelity Motion Cues in Flight Simulation - 131

Adaptive-Wall Perforated Test Section for Transonic Wind Tunnels - 140

An Unsteady Vortex Wake Model for Maneuvering Vehicles - 14

Simulation of Rotor Blade Element Turbulence - 345

DELAMINATING

Composite repair issues on the CF-18 aircraft - 56

Exfoliation corrosion and stress corrosion cracking behaviour of Al-Li alloys - 163

Repair technology for thermoplastic aircraft structures - 56

DELAY

Delayed Pilot Response in Windshear - 325

DELTA CLIPPER

Test aspect of single stage to orbit systems - 150

DELTA WINGS

Flowfield of A Wing Embedded in the Wake of A Bursted Vortex - 15

Hexahedron Based Grid Adaptation for Future Large Eddy Simulation - 245

DENSE PLASMAS

The numerical modelling of near-field HPM target coupling - 198

DENSITY (NUMBER/VOLUME)

Experimental Description and Modelizations of Meteoric Channels - 216

DENSITY MEASUREMENT

A Quantitative 2D Density Measuring System Using UV Rayleigh Scattering at an Atmospheric Wind Tunnel - 145

Rotational and Vibrational Temperature and Density Measurements by Planar Laser Induced NO-Fluorescence Spectroscopy in a Nonequilibrium High Enthalpy Flow - 161

Summary Report of the First International Symposium on Strain Gauge Balances and Workshop on AOA/Model Deformation Measurement Techniques - 266

Time Resolved Measurements of Turbine Blade Flow Phenomena - 261

DEPLOYMENT

Aerospace Approach for Virtual Manufacturing - 348

Communications and Situation Awareness on Hostile Borders - 217

Integrated Air Deployed Strike Surveillance (IADSS) - 287

Spacecraft deployable structure testing - 149

Telemedicine In Support of Operations in Remote Locations - 315

The Mobile Field Surgical Team (MFST): A Surgical Team for Combat Casualty Care in the Information Age - 311

DEPOLARIZATION

Statistical Analysis of Propagation Parameters for Polarimetric Radar Measurements - 230

DEPOSITION

In-Flight Particle Diagnostics for On-Line Process Control During Deposition of Plasma-Sprayed TBCs - 169

DESIGN ANALYSIS

Acoustic design of rotor blades using a genetic algorithm - 3

Adaptive Active Noise Reduction Headset for Helicopter Aircrew - 338

Aerodynamic Design of Nozzles for Subsonic and Transonic Wind Tunnels - 143

Aerodynamics of 3-D aircraft afterbodies - 3

Aerodynamics of Store Integration and Separation - 69

Aerodynamics of the ARMOR X7 UAV - 18

Aerospace navigation systems requirements for fixed wing aircraft - 97

An Object-Oriented Taxonomy for Part end Process Design - 349

Autonomous Navigation and Control Functions of the CL-327 VTOL UAV - 129

Control law design using H-infinity and mu-synthesis short-period controller for a tail-airplane - 122

Cryogenic Model Systems - 135

Design and testing of an aeroelastically scaled model structure - 65

Design and Validation of a Quiet Supersonic Wind Tunnel - 143

Design considerations for a suboptimal Kalman filter - 237

Design Considerations for Future Uninhabited Combat Air Vehicles - 7

Design Guidelines and Considerations for the UTA - 94

Design principles and algorithms for automated air traffic management - 42

Determination and Verification of Operational Maneuver Parameters and Time Histories - 84

Development of Close-Circuit Subsonic Wind Tunnel with Diametral Fan - 142

Dynamic Loading Considerations in Design of Modern Combat Aircraft - 85

Ejector-Driven Wind Tunnels - 141

Evolution of F-16 Loads and Requirements - 85

Evolution of Philosophy of Design Loads for Military Aircraft - 84

Experimental Study of a Low-Speed Wind Tunnel Test Section with a Free Jet - 142

Force Testing with Internal Strain Gage Balances - 135

Future Aerospace Technology in the Service of the Alliance - 5

Impaired Noise-Attenuation of Aircrew Helmets and Headsets for Cockpit Personnel Who Wear Glasses - 336

Improving Transonic Wind Tunnel Compressor Operation by Means of Guide Vane Angle Optimization - 142

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications - 306

Integrated Airframe Design Technology, 74 - 96

Large scale link 16/JTIDS networks - 205

Lessons Learned in the Development and Operation of Remotely Piloted Helicopters - 363

Method for the Calculation of 2D Supersonic Variable Nozzle Contours - 144

Model and Full Scale Investigations of the Low Frequency Vibration Phenomena of the DNW Open Jet - 142

Multidisciplinary Optimization Methods for Preliminary Design - 89

Parametrics as an Adequate Cost Estimation Tool for Affordable High-Tech Products - 379

Personal Active Noise Reduction with Integrated Speech Communication Devices: Development and Assessment - 337

Probabilistic Approaches: Composite Design - 84

Propulsion Considerations for an Advanced Vertical Take-Off and Landing (VTOL) Transport Aircraft - 113

Pulse Detonation Wave Engine - 154

RAH-66 Comanche Program Status - 82

Representative vehicle implementation: Rotary wing aircraft - 41

Scientific Barriers to Hypersonic Vehicle Design - 89

First medical test of the UH-60Q and equipment for use in US Army medevac helicopters - 359

Flight nurse school in the Hellenic Air Force - 295

Flying ambulances: The approach of a small air force to long distance aeromedical evacuation of critically injured patients - 358

Future Space Transportation Systems and their Potential Contribution to the NATO Mission - 148

International access to aeromedical evacuation medical equipment assessment data - 359

Mechanical Ventilator Performance During Aeromedical Evacuation - 313

Operational Determinants of Medical Planning - 311

Passenger Protection and Behaviour - 330

Re-engineering support to the patient movement process - 358

Recent Issues and Advances in Aeromedical Evacuation (MEDEVAC) - 356

Spinal Cord Injury Transport System - 313

The Canadian experience in UN alevac Sarajevo airlift: April 1993-October 1994 - 356

The impact of occupational cultures on coordination of emergency medical service crew - 358

The large-capacity rescue-helicopter CH-53 G - 359

The Provision of Intensive Care Medicine in Austera Field Locations - 312

The Role of Evacuation Modelling in the Development of Safer Air Travel - 330

United Nations aeromedical evacuation operations in the former Yugoslavia - 356

Use of Object Oriented Programming to Simulate Human Behavior in Emergency Evacuation of an Aircraft's Passenger Cabin - 330

Use of quality tools to re-engineer the Aeromedical Evacuation (AE) system - 356

EVALUATION

Appendix B: Weightings and Ratings Matrices - 343

Channel Evaluation from Predicted Zero-Crossing Analysis - 212

Environment Models and Threat Simulators: High Quality and Lower Cost Validation of EW Systems - 208

Evaluation of High-Angle-of-Attack Handling Qualities for the X-31A Using Standard Evaluation Manuevers - 128

The Modular Algorithm Concept Evaluation Tool (MACET) Workstation - 223

EVAPORATION

Remote Sensing of Evaporation Ducts Using SHF Propagation Measurements - 286

EVASIVE ACTIONS

Evasive Maneuvers and High-G Flight Safety After Sleep Deprivation - 308

EVOKED RESPONSE (PSYCHOPHYSIOLOGY)

Fatigue: Operational and Clinical Issues - 323

EXHAUST EMISSION

Application of FTIR Spectroscopy to Measurement of Gas Turbine Engine Exhaust Emissions - 161

DIAL Measurements on a Gas Turbine Exhaust - 272

Emission spectroscopy and pyrometry of propellant flames and solid rocket exhaust products - 153

Environmental impacts from launching chemical rockets - 289

Evaluation of ammonium nitrate propellant emissions - 175

UV Absorption Measurements of Nitric Oxide Compared to Probe Sampling Data for Measurements in a Turbine Engine Exhaust at Simulated Altitude Conditions - 273

EXHAUST GASES

Application of FTIR Spectroscopy to Measurement of Gas Turbine Engine Exhaust Emissions - 161

CARS Diagnostics on Model Gas Turbine Combustor Rigs - 273

DIAL Measurements on a Gas Turbine Exhaust - 272

Emission spectroscopy and pyrometry of propellant flames and solid rocket exhaust products - 153

Evaluation of ammonium nitrate propellant emissions - 175

The Impact of space rocket launches on the earth ozone layer - 289

EXHAUST NOZZLES

Flight test results of the F-16 aircraft modified with axisymmetric vectoring exhaust nozzle - 58

Neural Adaptive Control of an Engine Exhaust Nozzle - 116

The F-15 Active Aircraft: The Next Step - 115

EXHAUSTION

Fatigue: Operational and Clinical Issues - 323

EXPERIENCE

Centrifuge Training in the Canadian Forces: A Review of the First Six Years' Experience - 329

EXPERIMENT DESIGN

Forecast of the impulse noise of the engines at very short time of combustion - 176

Intrinsic Strength of Solid Propellant Bond Systems: Stress-Strain Behavior Bit-in-Tension with Rubber Materials - 184

EXPERT SYSTEMS

A Designer's Guide to Human Performance Modelling - 342

A Survey of Advanced Information Processing (AIP) Technology Areas for Crew Assistant System Development - 346

AIDEX: An expert system for aircraft identification - 352

An original numerical method for autonomous navigation - 353

Appendix B: Weightings and Ratings Matrices - 343

Development environment for knowledge-based systems. Some examples of application: The Copilot Electronic Project - 125

Functional development and field test of CASSY: A knowledge-based cockpit assistant system - 125

Knowledge-Based Functions in Aerospace Systems - 353

Multi-sensor data fusion in command and control and the merit of artificial intelligence - 352

EXPLORATION

The Shape of Things to Come: Revolution in Engineering Anthropometry - 341

EXPLOSIONS

Fire Safety Concept for a Modern Combat Aircraft - 33

EXPLOSIVES

Methods and Kinetic Models for the Lifetime Assessment of Solid Propellants - 179

Recycling military energetic materials into products for commercial explosive applications - 177

EXPOSURE

Adhesively bonded composite patch repair of cracked aluminum alloy structures - 54

Compliance with Anti-Malarial Preventive Measures by Deploying USAF Personnel for Operation Assured Response - 314

Corrosion protection measures for CFC/metal joints of fuel integral tank structures of advanced military aircraft - 164

Effect of loading direction and long-term aging on fatigue-crack growth in Al-Li alloy 2090 - 163

Neurological Influence in Push-Pull Effect - 297

Task Performance Throughout Prolonged High G Exposure - 321

The corrosion and protection of advanced aluminium-lithium airframe alloys - 162

The detection and analysis of galvanic damage in BMI/graphite fiber composites - 155

EXTERNAL STORE SEPARATION

A New Chimera Method for Calculating Missiles in Release Position - 69

Aerodynamics of Store Integration and Separation - 69

Engineering-Level Methods for Carriage Loads, High Alpha Launch From Pitching Aircraft, and Submunition Aerodynamics - 70

Experimental Techniques for Modelling Store Carriage and Release at Small Scales - 70

F18 External Stores Grid Measurement Testing in the IAR/NRC 1.5m Blowdown Wind Tunnel - 71

Flight Test Techniques for Weapon/Store Release Trajectory Analysis - 71

Methods for Predicting the Separation of Stores: State of the Art using MATRA Defense - 69

New Captive Trajectory System for the Large Subsonic S1MA Wind Tunnel of ONERA - 70

Practical Use of Computational Fluid Dynamics in Stores Clearances - 240

Store Separation - 30

Strategies for Modelling Aerodynamic Interference During Store Separation - 69

The Implications of Stores Carriage and Release for Aircraft Flight Control System Design - 71

Theoretical Prediction of Store Release Trajectory Using the FAME Method - 69

Unsteady Subsonic Aerodynamics for Maneuvering Wing/Fuselage/Pylon/Store Configuration and Store Separation Including Wake Effects - 241

Use of a Captive Trajectory System in a Wind Tunnel - 70

EXTERNAL STORES

Aerodynamics of Fuselage and Store-Carriage Interaction Using CFD - 240

Aerodynamics of Store Integration and Separation - 69

An Evaluation of Advanced CFD Codes for Stores at Incidence - 240

Development of NUFA and Its Application Within a Hybrid Store Load Prediction Method - 70

Estimation of Store Interference Loads Using Transonic Small Disturbance Theory and Influence Function Method - 71

F18 External Stores Grid Measurement Testing in the IAR/NRC 1.5m Blowdown Wind Tunnel - 71

The Implications of Stores Carriage and Release for Aircraft Flight Control System Design - 71

EXTINGUISHING

Extinguishing of Aircraft Interior Fires with Halon Replacements for Handheld Extinguishers - 33

Numerical Simulations of Aircraft Cabin Fire Suppression - 32

Performance of Fire Fighting Powders - 34

Synthesis and Properties of Various Alternative Fire Extinguishing Agents - 33

EXTRAPOLATION

Ballistic Missile Track Initiation From Satellite Observations with Extrapolation to Impact - 221

External Hypersonic Aerodynamics: State-of-the-Art and Future Perspective - 20

EXTREMELY HIGH FREQUENCIES

Atmospheric Path Loss and Scintillations Affecting Communications in the EHF Frequency Range - 210

EXTRUDING

Immersion Ultrasonic Analysis of Extruded Rocket Motors - 181

EYE (ANATOMY)

Point-of-Gaze Measurement in Aviation Research - 319

EYE PROTECTION

DIRCM: An Effective Technology for Aircraft Self Protection Against Optronic Missile Seekers - 97

F

F REGION

Turbulence in the Upper Atmosphere: Effects on Systems - 207

F-104 AIRCRAFT

From Manned to Unmanned: A Viable Alternative to the Scrapyard - 368

F-111 AIRCRAFT

Hazard Testing of Ferrocene Propellant in the SRAM-A Motor - 179

F-15 AIRCRAFT

Determinants of Situational Awareness in US Air Force F-15 Pilots - 318

Investigation of buffet load alleviation on a scaled F-15 twin tail model - 128

The F-15 Active Aircraft: The Next Step - 115

Use of Psychostimulants in Extended Flight Operations: A Desert Shield Experiment - 300

F-16 AIRCRAFT

A Data Acquisition System for the RNLAFL MLU F-16 Requirements and Proposal - 102

Application of advanced safety technique to ring laser gyro inertial navigation system integration - 38

Carrier Phase GPS Time, Space, Position Information Demonstration (CAPTIDE) - 46

Corrosion Prevention System for the F-16 Fighter Aircraft - 87

Evaluation of loads from operational flight maneuvers - 72

Evolution of F-16 Loads and Requirements - 85

F-16 System/Structural Upgrades - 86

Flight test results of the F-16 aircraft modified with axisymmetric vectored exhaust nozzle - 58

Looking for the simple PIO model - 27

The Dutch National Simulation Facility: Advancements in Simulator Technology and Application - 132

US Air Force/DEI flutter exciter test program - 64

F-18 AIRCRAFT

A Comparison of Pressure Measurements Between a Full-Scale and a 1/16-Scale F/A-18 Twin Tail During Buffet - 127

Canadian CF-18 Structural Life Management Program - 86

CF-18 Flight Flutter Test (FFT) techniques - 65

Composite repair of a CF18: Vertical stabilizer leading edge - 56

Evaluation of loads from operational flight maneuvers - 72

The Computation of Aircraft Store Trajectories Using Hybrid (Structured/Unstructured) Grids - 72

F-4 AIRCRAFT

Experimental Analysis of Effects of Anomalies in Structure of Radomes on Radome's Performance - 232

FABRICATION

Active Cooling of Fully Variable Hypersonic SERN Nozzles - 119

Advanced metal matrix composites - 155

Crash Resistant Composite Subfloor Structures for Helicopters - 80

Cryogenic Model Systems - 135

Force Testing with Internal Strain Gage Balances - 135

Introduction of Beryllium Aluminum Castings in the RAH-66 Comanche EOSS Program - 81

Probabilistic Approaches: Composite Design - 84

TBCs on Free-Standing Multilayer Components - 170

The Application of a Proprietary Sound-Attenuating Technology to Passive Circumaural Hearing Protector Design - 337

Thermal Barrier Coatings: The Thermal Conductivity Challenge - 168

Thermal Sprayed Nanostructured Thermal Barrier Coatings - 170

Virtual Manufacturing Technology Implementation at Boeing - 348

FAILURE

Bond Coat Considerations for Thermal Barrier Coatings - 172

Single Beat Late Potentials and the Risk of Human Factor Failure Due to the Sudden Cardiac Death - 300

FAILURE ANALYSIS

Fracture analysis of stiffened panels under biaxial loading with widespread cracking - 275

Instrumented Service Life Program for the Pictor Rocket Motor - 183

Landing Gear Shimmy: De Havilland's Experience - 68

Service Life Prediction of Solid Rocket Propellant Motors Stored in a Random Thermal Environment - 185

The Use of Simulation to Develop an Improved Understanding of Helicopter Tail Rotor Failures and Develop Aircrew Emergency Advice - 79

Widespread fatigue damage and single member failure prediction of military jet trainers of Czech design and production - 61

FAILURE MODES

Application of a System for the Monitoring of Aerodynamic Load and Stall in Multi-Stage Axial Compressors - 115

Deformation and Failure Mechanisms of DS CM 247 LC Under TMF and LCF Loading - 277

Numerical Strength Predictions of Adhesively Bonded Multilayered Joints - 280

Three-Dimensional Progressive Failure Analysis of Pin/Bolt Loaded Composite Laminates - 279

FAN BLADES

Shock-Wave Turbulent Boundary Layer Interaction in a Highly Loaded Transonic Fan Blade Cascade - 108

FAN FIELDS

A study of blade-vortex interaction aeroacoustics utilizing an independently generated vortex - 2

External noise of single rotor helicopters - 370

The role and status of Euler solvers in impulsive rotor noise computations - 3

FAST FOURIER TRANSFORMATIONS

Modeling nonperfect reflection from the sea for range-dependent ducting conditions - 200

FASTENERS

Bolted Joint Technology in Composite Structures: Analytical Tools Development - 158

Eddy current detection of pitting corrosion around fastener holes - 274

Stress Analysis of Open and Fastener Hole Composites Based on Three-Dimensional Spline Variational Technique - 279

FATIGUE (BIOLOGY)

Fatigue and Performance in the Air Traffic Control Environment - 324

FATIGUE (MATERIALS)

A concept for the evaluation of MSD based on probabilistic assumptions - 275

A special uniaxial coupon test specimen for the simulation of multiple site fatigue crack growth and link-up in fuselage skin splices - 61

Aluminum Alloy Forgings Property/Performance Attributes Focus: Fatigue and Durability Service Capabilities - 166

Avoiding WFD: A guide to the fatigue design regulations for British military aircraft - 62

Cyclic Fatigue and Environmental Effects with Adhesively Bonded Joints - 280

Damage tolerance to WFD (Widespread Fatigue Damage) on combat aircraft: An application to a metallic wing lower panel - 63

Durability and Damage Tolerance - 87

Fundamentals on Damage Monitoring - 73

Living with wide spread fatigue damage - 63

Multiple site fatigue damages of aircraft structures - 62

Overview of widespread fatigue damage: Risk assessment methodology - 61

Reliability, maintenance and life cycles of composite structures - 156

Statistical property of widespread fatigue damage - 274

The effect of proof pressure testing on the retardation of multi-site damage - 63

Three-Dimensional Progressive Failure Analysis of Pin/Bolt Loaded Composite Laminates - 279

USAF Aging Aircraft Program - 86

Widespread fatigue damage and single member failure prediction of military jet trainers of Czech design and production - 61

Widespread Fatigue Damage in Military Aircraft - 61

FATIGUE LIFE

Advanced Polymeric & Metallic Composite Materials for Space and Aerospace Vehicle Structures and Strength Optimization of Composite Structures and their Certification - 155

Aircraft Loads and Monitoring - 87

An Investigation on Surface Treatments for Improving the Fatigue Resistance of Titanium Alloys - 165

Axial-Torsional, Thermomechanical Fatigue Behavior of Haynes 188 Superalloy - 165

Certification of preforms and structure elements of composite materials - 156

Damage Mechanisms for Thermomechanical Fatigue of Aircraft Engines Materials - 104

Damage tolerance evaluation on the A7-P aircraft considering the PoAF usage - 63

Deformation and Failure Mechanisms of DS CM 247 LC Under TMF and LCF Loading - 277

Determination of A- and B-values of strength and fatigue resistance for preforms and elements of composites structural materials - 157

Effects of Cycle Type and Coating on the TMF Lives of CMSX6 - 276

Modelling of Thermomechanical Fatigue in Aero Engine Turbine Blades - 104

Non-Isothermal Fatigue: Methods, Results and Interpretation - 276

Thermo-Mechanical Behavior of IN 738 LC and SC 16 - 277

Three-Dimensional Progressive Failure Analysis of Pin/Bolt Loaded Composite Laminates - 279

TMF Experience with Gas Turbine Engine Materials - 103

TMF Life Prediction Approach for Turbine Blades - 277

V-22 Technical Challenges - 82

Widespread fatigue damage and single member failure prediction of military jet trainers of Czech design and production - 61

FLIGHT TRAINING

High Fidelity, Mobile, Net Workable Trainers: The Trailers of the Future? - 133

Modular Roll-On/Roll-Off Design Concept of a Rotorcraft Simulation Center - 79

Piloted Simulation in Low Altitude, High Speed Mission Training and Rehearsal - 134

Simulator Based Test Systems as a Measure to Improve the Prognostic Value of Aircrew Selection - 328

The Analysis of Safety Indicators in the Aviators' Training - 326

Visual Scenes for Battlefield Helicopter Operations: Evaluation of Requirements and How to Specify Them - 325

FLIGHT VEHICLES

The evolution of flight vehicle system identification - 66

FLIR DETECTORS

A FLIR case study using the Electro-Optical Tactical Decision Aid (EOTDA) Mark 3 - 374

A helmet mounted display for night missions at low altitude - 97

Combination of New Generation Optronic Sensors for Navigation and Attack Systems - 362

Multispectral image correlation for air-to-ground targeting - 333

SIRPH: Steerable infrared picture on helmet mounted display - 333

The Fusion of an IR Search and Track With Existing Sensors to Provide a Tracking System for Low Observability Targets - 221

FLOORS

Crash Resistant Composite Subfloor Structures for Helicopters - 80

FLOW CHARACTERISTICS

A New Approach to the Study of Organized Vortical Motion Affected by Body Forces - 252

Advanced Aerodynamic Measurement Technology - 7

Application of Laser-Ignited Fluorescence (LIF) to Liquid-Propellant Rocket Engine Testing - 154

Application of Two-Color Digital PIV for Turbomachinery Flows - 267

Applications of Three Dimensional Doppler Global Velocimetry to Turbo Machinery and Wind Tunnel Flows - 262

Case Studies of Applications of Turbulence Models in Aerospace - 249

Cavitation Self-Oscillations Intensify Technological Processes - 255

Control and Mathematical Model of Transonic Wind Tunnels - 139

Control of Cavity Parameters at Supercavitating Flow - 255

Dynamics of Vortices in Near-Wall Flows: Eigenfrequencies, Resonant Properties, Algorithms of Control - 253

Fluctuation Characteristics of Flows in Test Sections of High-Speed Wind Tunnels - 143

Fundamental Considerations for Testing in Cryogenic Tunnels - 135

Modeling of Turbulent Near-Wall Shear Flow Properties - 252

Numerical Simulation of Compressible Turbulent Flows Using the Reynolds-Averaged Navier-Stokes Equations - 249

Prediction of Losses Due to the Tip Clearance Presence in Axial Flow Machines - 106

Surge and Stall Characteristics of Axial-Centrifugal Compressors: The Enhancement to Engine Stability - 110

The Impulse Transonic Wind Tunnel U-11: New Effective Technology for Generation of Sub-, Trans- and Supersonic Gas Flow - 140

The Interaction between an Injected Vortex and a Rolling Up Vortex Sheet - 13

Three Dimensional Modelling and Secondary Flows Control in Gas Turbines - 106

Time Resolved Measurements of Turbine Blade Flow Phenomena - 261

Tip Leakage Loss Development in a Linear Turbine Cascade - 107

Vortex Wakes in Aerodynamics - 13

FLOW COEFFICIENTS

Aerodynamic Design of Axial-Flow Fans for Subsonic Wind Tunnels - 141

FLOW DISTORTION

Control of Goertler Vortices - 251

FLOW DISTRIBUTION

3-D LDA Measurements in an Annular Cascade for Studying Tip Clearance Effects - 259

A New View of the Dynamics of Reynolds Stress Generation in Turbulent Boundary Layers - 251

A Selection of Test Cases for the Validation of Large-Eddy Simulations of Turbulent Flows - 255

Advanced Measurement Technology at NASA Langley Research Center - 265

Aerodynamics of Fuselage and Store-Carriage Interaction Using CFD - 240

Aerothermodynamics and Propulsion Integration for Hypersonic Vehicles - 3

Air Intake and Air Intake / Combustion Interaction - 89

Airplane Flow-Field Measurements and the Flying Strut - 24

An Evaluation of Advanced CFD Codes for Stores at Incidence - 240

Analysis of Complex Flow Fields by Animation of PIV and High Resolution Unsteady Pressure Data - 256

Analysis of rotor forces in a ship airwake - 60

Compressibility effects on dynamic stall of oscillating airfoils - 8

Computational Approach to Weapons Bay Flow Field and Carriage Loads Predictions - 11

Computational Modeling and Validation for Hypersonic Inlets - 74

Design and Off-Design Simulation of Highly Integrated Hypersonic Propulsion Systems - 114

Development of NUFA and Its Application Within a Hybrid Store Load Prediction Method - 70

Effect of turbulence modeling on dynamic stall computations - 8

Estimation of Store Interference Loads Using Transonic Small Disturbance Theory and Influence Function Method - 71

Experimental Analysis of the Vortex Wake Structure behind a Propeller-Wing Configuration - 15

Experimental and Numerical Results on Spiral Vortex Breakdown - 17

F18 External Stores Grid Measurement Testing in the IAR/NRC 1.5m Blowdown Wind Tunnel - 71

Flow field investigation of a rotating helicopter rotor blade by three-component laser-Doppler velocimetry - 10

Flowfield of A Wing Embedded in the Wake of A Bursted Vortex - 15

Holographic and Tomographic Interferometry for the Study of Unsteady Compressible Flows - 258

Investigation of the yawed operation of wind turbines by means of a vortex particle method - 9

Laser Two-Focus Flow Field Investigation within a High-Speed High-Pressure Centrifugal Compressor - 259

Loss Prediction on Axial Flow Cascades Using a Navier-Stokes Solver - 108

Losses Prediction in Axial Flow Compressor Cascades Using an Explicit K-Epsilon Navier-Stokes Solver - 105

Numerical Simulations of Stator-Rotor Interactions of Compressor Blade Rows - 110

On Improving Parallelism in the Transonic Unsteady Rotor Navier Stokes (URNS) Code - 242

Review of recent aerodynamic research on wind turbines with relevance to rotorcraft. Data (and riddles) on dynamic inflow, flow field of yawed rotors, and rotating 3-D stall - 8

Stage Separation Aerothermodynamics - 377

The use of Kirchhoff's method in rotorcraft aeroacoustics - 371

Three-D Euler calculations of multibladed rotors in hover: Investigation of the wake capturing properties - 9

Tip Clearance Flow and Loss in Axial Compressor Cascades - 106

Unsteady Measurements in an Axial Flow Turbine - 109

FLOW EQUATIONS

Structured Adaptive Sub-Block Refinement for 3D Flows - 246

FLOW GEOMETRY

Vortex Wakes in Aerodynamics - 13

FLOW MEASUREMENT

3-D LDA Measurements in an Annular Cascade for Studying Tip Clearance Effects - 259

Advanced Aerodynamic Measurement Technology - 7

Application of 3D-Laser Two Focus Velocimetry in Turbomachine Investigations - 273

Development of PIV for Two and Three Component Velocity Measurements in a Large Low Speed Wind Tunnel - 145

Ground-Based Anemometer Measurements of Wake Vortices from Landing Aircraft at Airports - 15

Investigation of the Spray Dynamics of Aeroengine Fuel Injectors Under Atmospheric and Simulated Pressure Conditions - 272

Laser Two-Focus Flow Field Investigation within a High-Speed High-Pressure Centrifugal Compressor - 259

Laser-2-Focus Measurements of a Turbine Cascade with Leading Edge Film Cooling - 260

New advances in physiological measurements during high-G: Technology - 296

PSP: Intensity and Lifetime Measurements for Steady and Nonsteady Flow - 260

Sonic Nozzles for Mass Flow Measurement and Reference Nozzles for Thrust Verification - 249

UV Absorption Measurements of Nitric Oxide Compared to Probe Sampling Data for Measurements in a Turbine Engine Exhaust at Simulated Altitude Conditions - 273

Vortex Wakes in Aerodynamics - 13

FLOW RESISTANCE

Cavitation Self-Oscillations Intensify Technological Processes - 255

Substitution of Rolling for Slipping as an Effective Mechanism of Decreasing Hydrodynamic Drag - 250

FLOW STABILITY

Fluctuation Characteristics of Flows in Test Sections of High-Speed Wind Tunnels - 143

Initiation and Propagation of Flow Instabilities in Multi-Stage Axial Compressors - 110

Investigation of High-Speed Supercavitating Underwater Motion of Bodies - 253

Reduction of Overload on a Body Entering Water at High Speed - 255

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Self-Oscillation Flow Control in Free-Jet Wind Tunnels - 142

Transition in the Case of Low Free Stream Turbulence - 246

FLOW VELOCITY

Application of Laser-Induced Fluorescence (LIF) to Liquid-Propellant Rocket Engine Testing - 154

Applications of Three Dimensional Doppler Global Velocimetry to Turbo Machinery and Wind Tunnel Flows - 262

Cavitation Scale Effects: A Representation of Its Visual Appearance and Empirically Found Relations - 255

Demonstration of PIV in a Transonic Compressor - 267

Hydroblonics Principles of Drag Reduction - 251

Laser Two Focus Anemometry (L2F-3D) for Three-Dimensional Flow Analysis in an Axial Compressor - 259

Recent Developments in the Application of Laser Doppler Anemometry to Compressor Rigs - 260

Recent Progress in Whole-Field Non-Intrusive Measurements of 3-D Velocity Vectors and Particle Size - 262

Subsonic Wind Tunnel with Flow Speed Pulsation - 138

Temporary Arterial Shunts for Management of Major Extremity Arterial Injury: A Field Expedient Bridge to Definitive Surgical Reconstruction - 313

The Unsteady Structure of Simulated Turbine Film Cooling Flows From PIV - 261

FLOW VISUALIZATION

Advanced Aerodynamic Measurement Technology - 7

Advances in Cryogenic Wind Tunnel Technology - 134

Analysis of Complex Flow Fields by Animation of PIV and High Resolution Unsteady Pressure Data - 256

Application of Optical and Interference Methods in Experimental Aerodynamics - 374

Computational and Experimental Investigation of the Wakes Shed from Flapping Airfoils and their Wake Interference/Impingement Characteristics - 17

Computational fluid dynamics development and validation at Bell Helicopter - 239

Cooperative Programme on Dynamic Wind Tunnel Experiments for Manoeuvring Aircraft - 78

Endwall Boundary Layer Separations and Loss Mechanisms in Two Compressor Cascades of Different Stagger Angle - 104

Experimental Investigation of Flow Structure and Losses in a High Load Transonic Turbine Stage - 111

Initial results from the higher harmonic control aeroacoustic rotor test (HART) in the German-Dutch wind tunnel - 370

Inlet and Propulsion Integration of RAM Propelled Vehicles - 118

Recent Advances in Particle Image Velocimetry - 256

Shear Sensitive Liquid Crystals in Subsonic and Transonic Wind Tunnel Testing - 259

Three-D Euler calculations of multibladed rotors in hover: Investigation of the wake capturing properties - 9

Visualization and Measurement of Surface Shear Stress Vector Distributions Using Liquid Crystal Coatings - 258

Vortex Wakes in Aerodynamics - 13

FLUID BOUNDARIES

Emergence of Cavitating Profile - 254

FLUID DYNAMICS

(CFD) Computer Dependent Developments, Prospects and Challenges - 350

Aerospace 2020 - 7

An Unsteady Vortex Wake Model for Maneuvering Vehicles - 14

Review of Optical Methods for Fluid Dynamics - 256

Some Constraints Imposed on the Aerodynamic Development Process by Wind-Tunnel Circuit Design Characteristics - 138

Sonic Nozzles for Mass Flow Measurement and Reference Nozzles for Thrust Verification - 249

FLUID FLOW

A New Tool for Screen Integration in Internal Flow Systems and its Application to Wind Tunnel Design - 140

An Unsteady Vortex Wake Model for Maneuvering Vehicles - 14

Substitution of Rolling for Slipping as an Effective Mechanism of Decreasing Hydrodynamic Drag - 250

FLUID-SOLID INTERACTIONS

Measurement of Unsteady Wake-Boundary Layer Interaction Using Hot Films - 260

FLUTTER

A historical overview of flight flutter testing - 64

A maximum likelihood parameter estimation technique to analyse multiple input/multiple output flutter test data - 65

Advanced aeroservoelastic testing and data analysis - 64

Advances in the analysis of flight flutter test data - 66

Aeroelastic testing of an unmanned air vehicle - 65

CF-18 Flight Flutter Test (FFT) techniques - 65

CFD based corrections for linear aerodynamic methods - 23

Elements of the B-2 flight flutter test program - 66

Flight flutter testing of a turbo-prop aircraft by using external excitation devices - 64

Flight flutter testing of combat aircraft - 66

Flight flutter tests of transport civil aircraft with an Electronic Flight Control System - 126

Flutter flight test of the RANGER 2000 aircraft - 64

NLR-TUDelft experience in unsteady aerodynamics and aeroelastic simulation applications - 23

Numerical Unsteady Aerodynamic and Aeroelastic Simulation - 7

Parameter estimation methods for flight flutter testing - 65

Parametric Identification of Transonic Unsteady Flow Characteristics for Predicting Flutter of Fighter Aircraft With External Stores - 126

Pretension and reality of flutter-relevant tests - 66

Status on STRATO 2C flight flutter testing activities - 64

US Air Force/DEI flutter exciter test program - 64

Wind tunnel flutter testing on shingles in the transonic and supersonic speed regime - 11

FLUTTER ANALYSIS

A unified unsteady aerodynamic module for aeroelastic and MDO applications - 24

Advanced aeroservoelastic testing and data analysis - 64

Advances in the analysis of flight flutter test data - 66

Calculated viscous and scale effects on transonic aeroelasticity - 22

CFD based corrections for linear aerodynamic methods - 23

Elements of the B-2 flight flutter test program - 66

Fast staggered algorithms for the solution of three-dimensional nonlinear aeroelastic problems - 350

Flutter prediction for complex configurations - 129

Status on STRATO 2C flight flutter testing activities - 64

FLUX DIFFERENCE SPLITTING

A Flux Filter Scheme Applied to the Euler and Navier Stokes Equations - 244

Hybrid Upwind Splitting Methods for the Simulation of Thermal and Chemical Nonequilibrium Flows - 247

Multidimensional Upwind Dissipation for 2D/3D Euler/Navier-Stokes Applications - 244

FLUX VECTOR SPLITTING

Efficient Numerical Simulation of Complex 3D Flows with Large Contrast - 247

Hybrid Upwind Splitting Methods for the Simulation of Thermal and Chemical Nonequilibrium Flows - 247

FLY BY LIGHT CONTROL

Review of Photonic System Development for Propulsion Controls - 117

FLY BY WIRE CONTROL

Advanced flight control technology achievements at Boeing Helicopters - 124

An Investigation of Primary Flight Control Failure in a Piloted Helicopter - 79

ASRA: A New Tool for In-Flight Simulation. Current Status and Actuation Studies - 132

Digital autopilot design for combat aircraft in ALENIA - 124

Flight flutter testing of combat aircraft - 66

Impact of Electronic Flight Control System (EFCS) Failure Cases on Structural Design Loads - 128

Model following control for tailoring handling qualities: ACT experience with ATHeS - 123

SCARLET: DLR rate saturation flight experiment - 27

Stick and Feel System Design - 127

FLYING PERSONNEL

Head Injuries in Military Pilots - 298

FOCAL PLANE DEVICES

Review of Millimeter Wave Radiometry Potentialities: Activities in CERT-ONERA and DLR-HF - 220

FOKKER AIRCRAFT

A Multidisciplinary Approach in Computer Aided Engineering - 346

Flight flutter testing of a turbo-prop aircraft by using external excitation devices - 64

FOLIAGE

A Model for Estimating Electromagnetic Wave Attenuation in a Forest (EWAF) Environment - 210

FORCE DISTRIBUTION

Force Testing with Internal Strain Gage Balances - 135

FORCED VIBRATION

Elements of the B-2 flight flutter test program - 66

Flight flutter testing of a turbo-prop aircraft by using external excitation devices - 64

Flutter flight test of the RANGER 2000 aircraft - 64

Pretension and reality of flutter-relevant tests - 66

Status on STRATO 2C flight flutter testing activities - 64

US Air Force/DEI flutter exciter test program - 64

Effects of the specific military aspects of satellite navigation on the civil use of GPS/GLONASS - 38

Global Navigation Satellite Systems - 43

Integrated GPS/GLONASS User Equipment - 44

Introduction to Global Navigation Satellite System - 43

System Implications and Innovative Applications of Satellite Navigation - 43

GLUCOSE

Use of Point Of Care (POC) Laboratory Devices by Critical Care Air Transport Teams (CCATT) of the United States Air Force - 312

GLYCIDYL AZIDE POLYMER

Biodegradation of energetic compounds: Application to site restoration - 177

Characterization of the Degradation of the Polymer Binder in GAP-Based Propellants - 180

Development of environmentally acceptable propellants - 173

Development of less polluting propellants - 173

Evaluation of ammonium nitrate propellant emissions - 175

Hydrazinium nitroformate and its use as oxidizer in high performance solid propellants - 174

Life Time Assessment and Stability of AN/GAP Propellants - 180

GOERTLER INSTABILITY

Control of Goertler Vortices - 251

GOOGLES

Helicopters and Night Vision Goggles: A Synopsis of Current Research on Helicopter Handling Qualities during Flight in Degraded Visual Environments - 365

Impaired Noise-Attenuation of Aircrew Helmets and Headsets for Cockpit Personnel Who Wear Glasses - 336

GOVERNMENT PROCUREMENT

Cost Effectiveness in UK Defence Procurement: The COEIA - 380

Cost Reduction Strategies in Acquiring Aircraft Weapon Systems at - 382

GOVERNMENT/INDUSTRY RELATIONS

Lessons to be Drawn From the Civilian-Military Duality: Example of SAGEM Company - 378

Reorganisation of Evaluation and research to Support Future Defence Procurement - 381

Reorganization of the General Weapons Directorate (DGS) in France - 381

Strategic Management of the Cost Problem of Future Weapon Systems - 377

The Purpose and Status of IHPTET: 1995 - 112

The Value of S and T in Affordability - 31

GRADIENTS

A Gradient Based Line Detector - 285

GRAIN SIZE

Solid propellants for space launch vehicles not generating or little hydrochloric gas - 173

Thermal Sprayed Nanostructured Thermal Barrier Coatings - 170

GRAPHICAL USER INTERFACE

Point-of-Gaze Measurement in Aviation Research - 319

GRAPHITE

Bolted Joint Technology in Composite Structures: Analytical Tools Development - 158

The detection and analysis of galvanic damage in BMI/graphite fiber composites - 155

GRAPHITE-EPOXY COMPOSITES

Probabilistic Approaches: Composite Design - 84

Scarf repairs to graphite/epoxy components - 57

Structural modification and repair of C-130 wing structure using bonded composites - 55

GRAVIMETERS

Navigational technology of dual usage - 37

GRAVITATION

Neurological Influence in Push-Pull Effect - 297

Spacecraft deployable structure testing - 149

GRAVITATIONAL EFFECTS

Flight Test Performance Optimization of ITT VRS-1290 Speech Recognition System - 227

Vertical channel design considerations - 41

Voice Recognition in Adverse Aircraft Cockpit Environments - 226

GRAVITATIONAL PHYSIOLOGY

Current Concepts on G-Protection Research and Development - 334

G-protection basis/acceleration physiology - 334

Methods for measuring physiological responses and protection in man exposed to high +G(z) - 296

Negative to positive Gz acceleration transition - 295

Voice Recognition in Adverse Aircraft Cockpit Environments - 226

GRID GENERATION (MATHEMATICS)

A Meshless Technique for Computer Analysis of High Speed Flows - 243

A procedure based on line theory for calculating surface currents and coupling into the interior of large objects - 195

A unified unsteady aerodynamic module for aeroelastic and MDO applications - 24

Advances in Computational Capabilities for Hypersonic Flows - 21

Aeroservoelastic design, test verification and clearance of an advanced flight control system - 126

Dynamic stall control by variable airfoil camber - 8

Dynamic stall simulation applied to vertical-axis wind turbines - 9

Investigation of the yawed operation of wind turbines by means of a vortex particle method - 9

Methods for computation applied to helicopter rotors by ONERA - 9

New directions in rotorcraft computational aerodynamics research in the US - 1

Numerical Simulation of Internal and External Gas Dynamic Flows on Structured and Unstructured Adaptive Grids - 244

Parallel automated adaptive procedures for unstructured meshes - 351

Stall hysteresis and 3D effects on stall regulated wind turbines: Experiment and modelling - 9

Structured Adaptive Sub-Block Refinement for 3D Flows - 246

The Computation of Aircraft Store Trajectories Using Hybrid (Structured/Unstructured) Grids - 72

Theoretical Prediction of Store Release Trajectory Using the FAME Method - 69

Three-D Euler calculations of multibladed rotors in hover: Investigation of the wake capturing properties - 9

GROUND BASED CONTROL

Agility in the Context of Improved Operational Effectiveness - 90

Capricornio Launcher: An Approach to a Modular and Low Cost Software Architectural Design - 147

PREDATOR: Medium Altitude Endurance - 365

The Phoenix Target Acquisition and Surveillance System - 364

GROUND CREWS

Zolpidem, Sleepiness and the Psychomotor Capacities of Ground Personnel and Pilots - 310

GROUND HANDLING

C-160 Ground Handling Model Update Using Taxi Test Data - 345

Enhancement of Aircraft Ground Handling Simulation Capability - 95

GROUND OPERATIONAL SUPPORT SYSTEM

An integrated system for air to ground operations - 360

Enhancing Neurological Performance in Naval Aerospace USS Carrier Ground and Support Operations: Practical Challenges - 324

GROUND PENETRATING RADAR

Modeling and Wave-Oriented Processing of Scattering Data from Complex Environments: Location and Identification of Buried Objects by Ground Penetrating Radar - 284

GROUND RESONANCE

RAH-66 Comanche Case History - 83

GROUND STATIONS

Aerothermodynamic testing requirements for future space transportation systems - 150

Integrated Data Link for UTA Applications: Design Considerations and Development Results - 236

GROUND SUPPORT EQUIPMENT

SCCOA (Air Operation Conduct and Control System) program: Air Force requirements and its technical development - 204

System of Mission Registration and Restitution - 344

GROUND TESTS

Development of a modal testing support system for space-based radar satellite structures - 146

Ground structural coupling testing and model updating in the aeroservoelastic qualification of combat aircraft - 67

Ground testing and simulation assessment of space environment hazards - 152

Hypersonic aerodynamic/aerothermal test facilities available in Europe to support space vehicle design - 146

Performance and Guidance System Testing Using Differential GPS on a Falcon 20 Aircraft - 48

Pretension and reality of flutter-relevant tests - 66

Propellant handling provisions at a test facility for hypergolic bipropellant rocket engines - 178

Real-Gas Aerothermodynamics Test Facilities - 26

The Ground Loads During Phases of Rolling: The Civilian and Military Specifications - 85

GROUND-AIR-GROUND COMMUNICATION

CNS/ATM Concept: ICAO Prospective - 52

GROWTH

The Synthetic Environment: The Ultimate Defence Simulation? - 133

GUIDANCE (MOTION)

Dual use: Opportunities, payoffs, and challenges - 387

Experimental HPM Susceptibility, Exploitation of Smart Munitions - 207

Low Cost Multi-Sensor Suites for Surveillance and Weapon Guidance - 223

Monte Carlo Simulation Studies of Unguided and Guided Missiles Based on Probabilistic Modeling of Aerodynamic Coefficients - 18

Navigation Without Initialization of an Inertially Guided Bomb - 46

GUIDANCE SENSORS

Adaptive Real-Time Guidance Techniques - 237

Dual Usage In Military and Commercial Technology In Guidance and Control - 190

Dual use: Opportunities, payoffs, and challenges - 387

Dual-use micromechanical inertial sensors - 264

FADS: A demonstrator for MilComSat AOCs - 150

Guidance end Control for Future Air-Defence Systems - 186

Perspectives of Crew Assistance in Military Aircraft Through Visualizing, Planning and Decision Aiding Functions - 339

The DLR research programme on an integrated multi sensor system for surface movement guidance and control - 38

GUIDE VANES

Aerodynamic Design of Axial-Flow Fans for Subsonic Wind Tunnels - 141

Experimental Investigation of Flow Structure and Losses in a High Load Transonic Turbine Stage - 111

Improving Transonic Wind Tunnel Compressor Operation by Means of Guide Vane Angle Optimization - 142

Initiation and Propagation of Flow Instabilities in Multi-Stage Axial Compressors - 110

Numerical Simulations of Stator-Rotor Interactions of Compressor Blade Rows - 110

Unsteady Measurements in an Axial Flow Turbine - 109

Use of Liquid Crystal Techniques to Measure Film Cooling Heat Transfer and Effectiveness - 260

Wake Development Downstream of a Transonic Turbine Inlet Guide Vane with Trailing Edge Ejection - 107

GUN PROPELLANTS

Comparative Evaluation of the Lifetime of Composite and Simple Base Propellants - 182

Correlation Between Stability Results of Gun Propellants Obtained After Artificial Ageing at 50 C and Natural Ageing - 182

Environmental Aspects of Rocket and Gun Propulsion - 172

Establishing a science-based environmental cleanup level for liquid propellant XM46 - 289

Methods and Kinetic Models for the Lifetime Assessment of Solid Propellants - 179

Overview of the United States Army and Navy Gun Propellant Safety Surveillance Programs - 181

Service Life of Solid Propellant Systems - 178

The Canadian Gun Propellant Surveillance Program - 182

GUST LOADS

Advanced gust management systems: Lessons learned and perspectives - 123

The Impact of Dynamic Loads on the Design of Military Aircraft - 84

GYROSCOPES

AGARDograph on advanced astroinertial navigation systems - 40

Commercial usage of Navy components developed and manufactured by CRI Delfin - 264

Dual-use micromechanical inertial sensors - 264

High Integrity Global Precision Navigation Systems - 47

Inertial navigation - 39

Low Cost Inertial Systems - 53

H

H-53 HELICOPTER

The large-capacity rescue-helicopter CH-53 G - 359

HALF LIFE

Aviator's Grounding Time After Melatonin Administration During Rapid Deployment Missions - 310

HALOGEN COMPOUNDS

A Review of Recent Civil Air Transport Accidents/Incidents and their Fire Safety Implications - 31

Aircraft Fire Safety - 31

HARDWARE

A fast parallel computing machine for real time decision making: Applications to real time processing, war games, forest fire and fluid dynamics models - 352

HARMONIC CONTROL

Effect of higher harmonic control on helicopter rotor blade-vortex interaction noise: Prediction and initial validation - 2

Effect of individual blade control on noise radiation - 2

Initial results from the higher harmonic control aeroacoustic rotor test (HART) in the German-Dutch wind tunnel - 370

HARMONIC EXCITATION

Application of linearized Euler Equations to the estimation of flotation - 22

HARRIER AIRCRAFT

Aircraft Post Crash Management: The Royal Air Force Approach - 32

Flight demonstration of an advanced pitch control law in the VAAC Harrier aircraft - 124

Royal Air Force Experience of Mechanically-Fastened Repairs to Composite Aircraft Structures - 4

The VAAC Harrier Programme: Flying STOVL With 1-Inceptor Control - 117

HAZARDS

Aircraft Post Crash Management: The Royal Air Force Approach - 32

Corrosion prevention with environmentally compliant materials: A design challenge - 164

Environmentally Safe and Effective Processes for Paint Removal - 188

Ground testing and simulation assessment of space environment hazards - 152

Hazard Testing of Ferrocene Propellant in the SRAM-A Motor - 179

High power microwave hazard facing smart munitions - 196

The concept of the space system based on the Rocket launch vehicle of light-weight class for direct sounding of large-scale natural hazards - 147

Wake Vortex Decay Near the Ground under Conditions of Strong Stratification and Wind Shear - 14

Wake Vortices' Effects and the Need for Prompt Action: A US View - 13

HEAD (ANATOMY)

Addressing Front Row HIC Requirements in Commercial Airplanes - 340

Closed Head Injury and the Military Aviator: Assessing Cognitive Dysfunction and Seizure Risk - 305

Unconstrained Maneuver Air Vehicle: A Configuration Development - 94

HILBERT TRANSFORMATION

Discrete Hilbert Transform - 213

HISTORIES

Historical Review of Piloted Simulation at NASA Ames - 130

PIO: A historical perspective - 26

HMX

Critical fluid demilitarization and ingredient reclamation technology - 176

Improved environmental properties of a solid composite propellant - 173

HOLES (MECHANICS)

Destructive teardown of a C-141 lower inner wing surface - 62

Eddy current detection of pitting corrosion around fastener holes - 274

Laser-2-Focus Measurements on a Turbine Cascade with Leading Edge Film Cooling - 260

POD assessment of NDI procedures using a round robin test - 274

Stress Analysis of Open and Fastener Hole Composites Based on Three-Dimensional Spline Variational Technique - 279

HOLOGRAPHIC INTERFEROMETRY

Advances in Aerodynamic Holography - 265

Application of Optical and Interference Methods in Experimental Aerodynamics - 374

Holographic and Tomographic Interferometry for the Study of Unsteady Compressible Flows - 258

HOLOGRAPHY

Development and flight testing of an Obstacle Avoidance System for US Army helicopters - 29

Recent Progress in Whole-Field Non-Intrusive Measurements of 3-D Velocity Vectors and Particle Size - 262

SIRPH: Steerable infrared picture on helmet mounted display - 333

The emerging field of artificial neural networks and their optoelectronic implementations - 353

Vibrational Analysis of Engine Components Using Neural-Net Processing and Electronic Holography - 355

HOMING DEVICES

Digital Video Compression for Weapons Control and Bomb Damage Indication - 362

Multispectral image correlation for air-to-ground targeting - 333

Precision Imaging Strike Technology Integration Laboratory (PISTIL) - 362

HOMOGENEITY

Aerosol maps made during MAPTIP - 292

HOMOGENEOUS TURBULENCE

A Selection of Test Cases for the Validation of Large-Eddy Simulations of Turbulent Flows - 255

HONEYCOMB STRUCTURES

Composite repair issues on the CF-18 aircraft - 56

Composite repair of a CF18: Vertical stabilizer leading edge - 56

Design Loads for Bonded and Bolted Joints - 280

External patch repair of CFRP/honeycomb sandwich - 57

Field repair materials for naval aircraft - 55

Scarf repairs to graphite/epoxy components - 57

Surface Treatment and Bonding of Thermoplastic Composites - 158

HORIZONTAL FLIGHT

Aeroacoustic calculation of helicopter rotors at DLR - 371

Flow field investigation of a rotating helicopter rotor blade by three-component laser-Doppler-velocimetry - 10

Forward flight rotor airloads predictions using a coupled Navier-Stokes/full-potential analysis - 60

Methods for computation applied to helicopter rotors by ONERA - 9

HORMONES

Aviator's Grounding Time After Melatonin Administration During Rapid Deployment Missions - 310

Melatonin and its Role in Circadian Rhythm Disruption - 331

Urinary Melatonin Excretion in Airline Pilots Submitted to Transmeridian Flights - 310

HOT-FILM ANEMOMETERS

Measurements With Surface Mounted Hot-Film Sensors on Boundary Layer Transition In Wake Disturbed Flow - 261

HOT-WIRE ANEMOMETERS

Experimental and Numerical Investigation of Unsteady Flow Properties in a Stator of Multistage Axial Flow compressor - 108

Rotor-Stator Interaction Effects on Turbulent Boundary Layers - 108

Turbulence and Transition In Secondary Flows In a Turbine Cascade - 106

HOVERING

A boundary integral method for unified transonic aerodynamic and aeroacoustic analysis of hovering rotors - 10

Aeroacoustic calculation of helicopter rotors at DLR - 371

Aerodynamics and Aeroacoustics of Rotorcraft - 1

Analysis of rotor forces in a ship airwake - 60

Flow field investigation of a rotating helicopter rotor blade by three-component laser-Doppler-velocimetry - 10

In flight research with instrumented main and tail rotor blades using the DRA Bedford aeromechanics research Lynx helicopter - 60

Methods for computation applied to helicopter rotors by ONERA - 9

Predicting helicopter external noise: Numerical methods as conceived by an industrialist - 371

The role and status of Euler solvers in impulsive rotor noise computations - 3

The use of Kirchhoff's method in rotorcraft aeroacoustics - 371

Three-D Euler calculations of multibladed rotors in hover: Investigation of the wake capturing properties - 19

HTPB PROPELLANTS

Aging Studies on HTPB Propellants by Dynamic Mechanical Analysis - 184

Gas pollutants from ammonium nitrate based propellants - 175

Service Life Prediction Methodologies Aspects of the TTCP KTA-14 UK Programme - 182

Shock sensitivity of ammonium nitrate based propellants - 174

HUMAN BEHAVIOR

Passenger Protection and Behaviour - 330

The Analysis of Safety Indicators in the Aviators' Training - 326

Use of Object Oriented Programming to Simulate Human Behavior in Emergency Evacuation of an Aircraft's Passenger Cabin - 330

HUMAN BEINGS

Task Performance Throughout Prolonged High G Exposure - 321

The Role of Linear Acceleration in Visual-Vestibular Interactions and Implications in Aircraft Operations - 321

HUMAN BODY

Calculating the 3-D absorbed power distribution inside a human body that is illuminated by an incident EM field using the WCG-FFT method - 296

Principles of Crash Survivability - 306

HUMAN CENTRIFUGES

Methods for measuring physiological responses and protection in man exposed to high +G(z) - 296

Selection and special physiological training of flying personnel to high +G(z)-maneuverable flights-main concept - 316

Selection and training of MiG-29 and future fighter pilots - 317

HUMAN FACTORS ENGINEERING

A Designer's Guide to Human Performance Modelling - 342

A helmet mounted display for night missions at low altitude - 97

Active Hearing Protectors: New Developments and Measurement Procedures - 336

Adaptive Active Noise Reduction Headset for Helicopter Aircrew - 338

Aeromedical Support Issues in Contingency Operations - 307

Aerospace 2020, 7 - 366

Aircraft Noise Profiles and the Efficiency of Noise Protection Devices in the Royal Danish Air Force - 339

An Exploratory Study of the Human-Machine Interface for Controlling Maritime Unmanned Air Vehicles - 336

An integrated system for air to ground operations - 360

At the Heart of Simulator Formation: the Transfer of Training - 329

ATM as Part of the Aerospace Engineering Curriculum - 50

Audio Display Technology - 372

Audio Effectiveness in Aviation - 224

Aviation Pathology - 306

Basilar Skull Fracture Resulting From Compression Neck Loading - 303

Case Study Involving FAIT - 343

Constraints in the Application of Personal Active Noise Reduction Systems - 337

Covert Night/Day Operations for Rotorcraft (CONDOR) programme - 360

Fatigue: Operational and Clinical Issues - 323

Flight Demonstration of an Integrated 3-D Auditory Display for Communications, Threat Warning, and Targeting - 225

Glass Cockpit Operational Effectiveness - 71

Human Reliability Assessment Tools: PHRASE 2 - 342

Human Role in ATM: Support for Decision Making - 50

Impact Biodynamics of Human Skull Fracture - 302

Increase of High-sustained +G(z) tolerance at the expense of pilot's working posture change - 295

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications: General Concepts and Objectives - 37

Intelligent Decision Aids for Human Operators - 377

Laboratory Evaluation of Hearing Aid Developed for Combat Aviation - 336

A viscous-Inviscid interaction model for rotor aerodynamics - 239
Calculated viscous and scale effects on transonic aeroelasticity - 22
Computational and Experimental Investigation of the Wakes Shed from Flapping Airfoils and their Wake Interference/Impingement Characteristics - 17
Direct Numerical Simulation of the Breakdown of Aircraft Wake Vortices - 17
Experimental Assessment of the Extended Betz Method for Wake Vortex Prediction - 14
Numerical investigation of Inviscid and Viscous Interaction in a Transonic Compressor - 111
Present capabilities of predicting two-dimensional dynamic stall - 59
The Inviscid Motion of a Vortex Pair in a Compressible and Stratified Atmosphere - 17
Viscous/Inviscid and Real-Gas Effects Associated with Hypersonic Vehicles - 248
- IODINE LASERS**
Use of Iodine Fluorescence Induced by Laser for Measurements of Pressure, Temperature, and Speed - 268
- ION BEAMS**
Environmentally Benign Ion Beam Surface Treatments - 191
- ION ENGINES**
US In-space electric propulsion experiments - 151
- ION IMPLANTATION**
An Investigation on Surface Treatments for Improving the Fatigue Resistance of Titanium Alloys - 165
Environmentally Benign Ion Beam Surface Treatments - 191
- ION PROPULSION**
US In-space electric propulsion experiments - 151
- IONIZATION**
Experimental Description and Modelizations of Meteoric Channels - 216
Micron-sized droplets irradiated with a pulsed carbon dioxide laser: Measurement of explosion and breakdown thresholds - 239
- IONIZATION FREQUENCIES**
Modeling and numerical simulation of microwave pulse propagation in air breakdown environment - 197
- IONOSPHERIC DISTURBANCES**
Collection of Data and Extremely Low-Power Finder for Telecommunications - 235
Propagation Diversity Constraints on Reception of GPS Signals at High and Equatorial Latitudes - 236
The Ionospheric Factor: Effects and Mitigation in RF Navigation, Surveillance and Communication - 206
- IONOSPHERIC PROPAGATION**
An Analytic Ray Tracing Model for HF Ionospheric Propagation - 209

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

An Improved Model of Ionospheric Absorption at HF High Latitude Paths - 209

Expectations from EMET and OESEE Ground Listening of Possible E.M. Events Generated by the TSS 1R - 286

Multi-Port Digital Transmission System Using the Ionospheric Pathway - 217

Nostramrine: A Concept of Multistatic Detection Adjusted to Surveillance of Low Altitude Targets - 262

IONOSPHERIC SOUNDING

Collation of Data and Extremely Low-Power Finder for Telecommunications - 235

HF Transmitter Location Using Super-Resolution DF and Ionospheric Sounding - 235

IRRADIANCE

Critical heat flux panel experiments - 239

New Fire Safe Material for Cabin Interiors - 35

ITERATIVE SOLUTION

A Simple Model for the Aero-Hydrodynamics of Ekranoplans - 253

Development of a Parallel Implicit Algorithm for CFD Calculations - 243

Practical Aspects of Krylov Subspace Iterative Methods in CFD - 245

Seamless Transition From Product Concept to Production and Deployment - 351

Structured Adaptive Sub-Block Refinement for 3D Flows - 246

J**JAMMING**

Analysis of Differential Global Positioning System (DGPS) Techniques and GPS Jamming on Precision Guided Munition (PGM) Performance - 46

Electronic Countermeasures against Synthetic Aperture Radars - 219

High Integrity Global Precision Navigation Systems - 47

High Integrity Global Precision Positioning - 53

JAS-39 AIRCRAFT

Future Combat Aircraft Development in Europe - 367

SAAB experience with PIO - 28

JET AIRCRAFT

Neurological Influence in Push-Pull Effect - 297

JET CONTROL

New Test Cell Design Methods Based on Integrated Usage of Calculated and Experimental Researches - 139

JET ENGINE FUELS

Impact Study on the Use of JET A Fuel in Military Aircraft During Operations in Europe - 178

JET ENGINES

Airseals for Advanced Military Jet Engines - 271

EHD Analysis of a Roller/Inner Ring Contact in a Jet Engine Roller Bearing - 270

Tribology for Aerospace Systems - 269

JET EXHAUST

Development of a Tactical Helicopter Infrared Signature Suppression (IRSS) System - 80

JET FLOW

Alleviation of Axial Static Pressure Gradients in 2D Perforated Test Section of IAR Blowdown Wind Tunnel - 140

Asymptotic Theories of Incompressible Water Entry - 254

Laser-2-Focus Measurements on a Turbine Cascade with Leading Edge Film Cooling - 260

Model and Full Scale Investigations of the Low Frequency Vibration Phenomena of the DNW OpenJet - 142

Optical Diagnostics for Cryogenic Liquid Propellants Combustion - 162

Recent Progress in Whole-Field Non-Intrusive Measurements of 3-D Velocity Vectors and Particle Size - 262

Turbulent Combustion - 160

JET LAG

Urinary Melatonin Excretion in Airline Pilots Submitted to Transmeridian Flights - 310

JOINTS (JUNCTIONS)

Application of Several Global Methods for Non Destructive Evaluation of Small Solid Propellant Motors - 180

Status of bonded boron/epoxy doublers for military and commercial aircraft structures - 54

K**K-EPSILON TURBULENCE MODEL**

A Projection Methodology for the Simulation of Unsteady Incompressible Viscous Flows Using the Approximate Factorization Technique - 247

Flowfield Prediction of Three-Dimensional Wing Trailing Vortices using Advanced Turbulence Models - 13

Losses Prediction in Axial Flow Compressor Cascades Using an Explicit K-Epsilon Navier-Stokes Solver - 105

Recent Ameliorations of the Code FLU3M for Calculating Compressible Flows - 246

KALMAN FILTERS

A KF-Based Integration System for Land Vehicle Tracking From Real DGPS and INS Data - 52

A Navigation System Concept for a Modern Anti-Ship Missile - 47

An overview of a generic multi-sensor integrated navigation system design - 40

Design considerations for a suboptimal Kalman filter - 237

Multiple hypothesis tracking versus Kalman filter with nearest neighbor correlation. Performance comparison - 205

Multisensor data fusion for integrated maritime surveillance - 193

Vertical channel design considerations - 41

KERNEL FUNCTIONS

An Approach Towards Integration of a Modular Core Avionics System Kernel - 101

Losses Prediction in Axial Flow Compressor Cascades Using an Explicit K-Epsilon Navier-Stokes Solver - 105

KEROSENE

Impact Study on the Use of JET A Fuel in Military Aircraft During Operations in Europe - 178

KINETIC THEORY

A Second Order Kinematic Scheme Preserving the Positives of Euler Compressible Equations for Flows of Non-Auto-Adaptive Structures - 243

KIRCHHOFF LAW OF RADIATION

The role and status of Euler solvers in impulsive rotor noise computations - 3

The use of Kirchhoff's method in rotorcraft aero-acoustics - 371

KLYSTRONS

Applications of relativistic klystron amplifier technology - 238

Upgrading of the RF tubes of the present state of the art - 198

KNOWLEDGE BASED SYSTEMS

Evaluation of the techniques of fuzzy control for the piloting an aircraft - 122

Knowledge-based guidance and control functions - 332

Knowledge-based systems applications for automating spacecraft operations: Users feedback and lessons learned - 148

Perspectives of Crew Assistance in Military Aircraft Through Visualizing, Planning and Decision Aiding Functions - 339

Using a Red Team to devise countermeasures - 194

KNOWLEDGE BASES (ARTIFICIAL INTELLIGENCE)

AIDEX: An expert system for aircraft identification - 352

Development environment for knowledge-based systems. Some examples of application: The Copilot Electronic Project - 125

Knowledge-Based Functions in Aerospace Systems - 353

KNOWLEDGE REPRESENTATION

Evaluation of the techniques of fuzzy control for the piloting an aircraft - 122

L**LAGOONS**

Use of Remote Sensing for Monitoring the Lagoon Koeycegiz and its Environment in Turkey - 286

LAGRANGIAN FUNCTION

Topology Optimisation of 3D Linear Elastic Structures - 278

LAMINAR BOUNDARY LAYER

Shock Wave Boundary Layer Interactions in High Mach Number Flows: A Critical Survey of Current Numerical Prediction Capabilities - 262

Skin Friction Measurement and Transition Detection Techniques for the Ludwig-Tubes at DLR - 258

LAMINAR FLOW

A Second-Order Finite-Volume Scheme Solving Euler and Navier-Stokes Equations on Unstructured Adaptive Grids with an Implicit Acceleration Procedure - 243

Advances in Cryogenic Wind Tunnel Technology - 134

Aerothermal Characteristics of Shock/Shock Interaction Regions in Hypersonic Flows - 20

Characteristics of the NASA-Ames Laminar Flow Supersonic Wind Tunnel for Unique Mach 1.6 Transition Studies - 143

Experimental Studies on the Boundary Layer Development in Penguins: Mechanisms of Turbulence Control and Their Applicability to Engineering - 252

Extrapolation From Wind Tunnel to Flight: Shuttle Orbiter Aerodynamics - 26

Hypersonic Laminar-Turbulent Transition - 263

Three-Dimensional Direct Numerical Simulations of Wake Vortices: Atmospheric Turbulence Effects and Rebound with Crosswind - 17

Turbulence in Compressible Flows - 248

Wake Passing in LP Turbine Blades - 109

LAMINATES

3-D Composites in Primary Aircraft Structure Joints - 159

A Review of Composite Joint Analysis Programs - 158

A Summary of Damage Mechanisms and Mechanical Property Degradation in Titanium Matrix Composites Subjected to TMF Loadings - 157

Analysis Method for Bolted Composite Joints Subjected to In-Plane Shear Loads - 279

Attachment of Ceramic Matrix Composites of AFR700B Composites for Exhaust Washed Airframe Structures - 159

Bolted Joint Technology in Composite Structures: Analytical Tools Development - 158

Certification of preforms and structure elements of composite materials - 156

Development of a Stressing Method for Bolted Joints - 279

Development of Failure in Bolted Joints in Woven CFRP Laminates - 279

Electromagnetic shielding properties of composite materials - 197

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Structural verification of the Space Station Freedom Force Moment Sensor (FMS) using finite element modelling techniques and qualification testing - 149

LAY-UP

Field repair materials for naval aircraft - 55

LAYOUTS

Heat Loads in Hypersonic Vehicle Design - 88

LEAD (METAL)

Chemical Safe Life Predictions for Cast Double Base Rocket Propellants - 185

Infrared and millimeter wave detection using thin films of Pb doped BiSrCaCuO superconductor - 263

LEADERSHIP

Pilot Testing in Virtual Environments - 95

LEADING EDGE SLATS

C-17A Avionics Flight Test Program - 6

LEADING EDGES

Boundary Layer and Loss Studies on Highly Loaded Turbine Cascade - 105

Cascade Simulation of Multiple Shock Passing From Upstream Blade Rows - 112

Composite repair of a CF18: Vertical stabilizer leading edge - 56

Compressibility effects on dynamic stall of oscillating airfoils - 8

Computational Modelling of Cascade-Blade Flow with Linear and Non-Linear Low-Re Eddy-Viscosity Models - 105

Drag Prediction and Transition in Hypersonic Flow - 21

Dynamic stall control by variable airfoil camber - 8

Laser-2-Focus Measurements on a Turbine Cascade with Leading Edge Film Cooling - 260

Present capabilities of predicting two-dimensional dynamic stall - 59

LEAKAGE

Tip Clearance Flow and Loss in Axial Compressor Cascades - 106

Tip Leakage Loss Development in a Linear Turbine Cascade - 107

Unsteady Flow and Loss Production in Centrifugal and Axial Compressor Stages - 111

LEAR JET AIRCRAFT

Use of Virtual Prototyping in Design and Manufacturing - 347

LECTURES

Aging Combat Aircraft Fleets: Long Term Applications - 86

Capsule Aerothermodynamics - 19

System Implications and Innovative Applications of Satellite Navigation - 43

Turbulence in Compressible Flows - 248

LETHALITY

Modern Fighter Mission Avionics: The Joint Strike Fighter Avionics Architecture - 101

LETHARGY

Enhancing Neurological Performance in Naval Aerospace USS Carrier Ground and Support Operations: Practical Challenges - 324

LEUKOCYTES

Hypoxia Induced Impairment of Granulocyte Function - 298

LIBRARIES

Directory of Defence and Aerospace Information Centers - 382

LIFE (DURABILITY)

Ageing and Life Prediction of Composite Propellant Motors - 179

Evaluation of the Service Life of Tactical Motors - 185

Modelling of Thermomechanical Fatigue in Aero Engine Turbine Blades - 104

Probabilistic Service Life Prediction for Solid Propellant Motors Subjected to Environmental Thermal Loads - 184

PSP: Intensity and Lifetime Measurements for Steady and Nonsteady Flow - 260

Service Life Determination of Rocket Motors by Comprehensive Property Analysis of Propellant Grains - 185

Service Life Prediction Methodologies Aspects of the TTCF KTA-14 UK Programme - 182

Service Life Prediction of Solid Rocket Propellant Motors Stored in a Random Thermal Environment - 185

Solid Rocket Motor Service Life Prediction Using Nonlinear Viscoelastic Analysis and a Probabilistic Approach - 184

Test method and test results for environmental assessment of aircraft materials - 163

The Effect of TBC Utilization in the Design of Robust Aircraft Combustors - 172

LIFE CYCLE COSTS

A Discussion of a Modular Unmanned Demonstration Air Vehicle - 91

Acquisition and Demonstration of Technologies for Future Military Engines: The AMET Program - 112

Airframe Inspection Reliability - 275

Future Technology Requirements for UK Combat Engines - 112

Maintenance-Free Aircraft - 96

Propulsion Integration Issues for Advanced Fighter Aircraft - 118

Technology Transparency in Future Modular Avionic Systems - 99

Technology: Solution for the Next Generation of Affordable Strike Fighters - 381

LIFE SUPPORT SYSTEMS

Advanced Oxygen Systems for Aircraft - 335

Aeromedical Support Issues in Contingency Operations - 307

Life Support for Trauma and Transport (LSTAT(trademark)): A NATO Litter-Based Critical Care Transport Platform - 312

LIFT

An Empirical Correction Method for Improving Off-Axes Response Prediction in Component Type Flight Mechanics Helicopter Models - 81

Computational fluid dynamics development and validation at Bell Helicopter - 239

Evaluation of aerodynamic and dynamic models of the rotors of helicopters by confrontation to the experiment - 10

LIFT DRAG RATIO

Adaptive Aircraft Wing - 74

Design of High L/D Vehicles Based on Hypersonic Waveriders - 88

Performance - 83

LIFT FANS

Powerplants and Lift Systems for ASTROVL Aircraft: The Challenges to an Engine Maker - 113

Propulsion Considerations for an Advanced Vertical Take-Off and Landing (VTOL) Transport Aircraft - 113

LIFTING BODIES

On the Interaction between Topographical Wind and Landing Aircraft - 76

Separation of lifting vehicles at hypersonic speed wind tunnel tests and flight dynamics simulation - 11

LIGHT (VISIBLE RADIATION)

Melatonin and its Role in Circadian Rhythm Disruption - 331

LIGHT AMPLIFIERS

Photoinjector-driven chirped-pulsed free electron maser - 268

Ultra-fast nonlinearities in semiconductor optical amplifiers for applications in all-optical networks - 374

LIGHT BEAMS

Using the Laser Light Sheet Technique in Combustion Research - 162

LIGHT TRANSMISSION

Nonlinear Optical Frequency Conversion Materials for Multi-Band Remote Sensing and Surveillance - 288

LINEAR ACCELERATORS

Photoinjector-driven chirped-pulsed free electron maser - 268

LINEAR QUADRATIC REGULATOR

An Advanced Control System for Turbofan Engine: Multivariable Control and Fuzzy Logic (Application to the M88-2 Engine) - 115

LINEAR TRANSFORMATIONS

Robust control: A structured approach to solve aircraft flight control problems - 122

LINEARIZATION

Aeroelasticity and C.F.D. - 22

Application of linearized Euler Equations to the estimation of flotation - 22

LININGS

Improving Solid Lubricated Aerospace Bearings - 270

The Effect of TBC Utilization in the Design of Robust Aircraft Combustors - 172

Thermal Mechanical Fatigue and its Effect on Combustor Design - 104

Thermographic Detection of Bond Defects within Models of Solid Propellant Motors - 180

LIQUID AMMONIA

Critical fluid demilitarization and ingredient reclamation technology - 176

LIQUID CRYSTALS

Shear Sensitive Liquid Crystals in Subsonic and Transonic Wind Tunnel Testing - 259

Surface Forces Measurements with High Spatial and Temporal Resolution by Means of Liquid Crystal Foils, Piezofolios and Surface Hot-Film Arrays - 258

Use of Liquid Crystal Techniques to Measure Film Cooling Heat Transfer and Effectiveness - 260

Visualization and Measurement of Surface Shear Stress Vector Distributions Using Liquid Crystal Coatings - 258

LIQUID OXYGEN

Advanced Hybrid Oxygen System-Medical - 313

Optical Diagnostics for Cryogenic Liquid Propellants Combustion - 162

LIQUID PHASES

Development of Planar Laser Induced Fluorescence for Fuel: Application to Gas Turbine Combustion - 269

LIQUID PROPELLANT ROCKET ENGINES

Demilitarization of Lance rocket motors - 153

Optical Diagnostics for Cryogenic Liquid Propellants Combustion - 162

LIQUID ROCKET PROPELLANTS

Application of Laser-Induced Fluorescence (LIF) to Liquid-Propellant Rocket Engine Testing - 154

Dynamic Response of a Cryogenic Lox Pump to Pressure and Massflow Fluctuation - 269

Environmental impacts from launching chemical rockets - 289

Establishing a science-based environmental cleanup level for liquid propellant XM46 - 289

Noise associated to rocket engine testing and noise reduction measure taken on DASA's test facilities in Ottobrunn - 371

Optical Diagnostics for Cryogenic Liquid Propellants Combustion - 162

LIQUID-VAPOR INTERFACES

A Simple Model for the Aero-Hydrodynamics of Ekranoplans - 253

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

LOAD DISTRIBUTION (FORCES)

Evaluation of loads from operational flight maneuvers - 72

LOAD TESTS

A special uniaxial coupon test specimen for the simulation of multiple site fatigue crack growth and link-up in fuselage skin splices - 61

Exfoliation corrosion and stress corrosion cracking behaviour of Al-Li alloys - 163

On aircraft repair verification of a fighter A/C integrally stiffened fuselage skin - 55

LOADS (FORCES)

Aircraft Loads and Monitoring - 87

Aluminum Alloy Forgings Property/Performance Attributes Focus: Fatigue and Durability Service Capabilities - 166

An Investigation on a Bolted-Cold Bonded Joint for Large Diameter Structures - 280

Analysis of rotor forces in a ship airwake - 60

Design Loads for Bonded and Bolted Joints - 280

Environmental Data for Rocket Motor Service Life Assessment - 185

Eurofighter 2000 Structural Design Criteria and Design Loading Assumptions - 85

Evolution of F-16 Loads and Requirements - 85

Evolution of Philosophy of Design Loads for Military Aircraft - 84

Experimental Investigation of Flow Structure and Losses in a High Load Transonic Turbine Stage - 111

Heat Loads in Hypersonic Vehicle Design - 88

Impact of Electronic Flight Control System (EFCS) Failure Cases on Structural Design Loads - 128

Influence of Thrust Vectoring System (TVS) on Structural Design Loads - 85

Loads and Requirements for Military Aircraft - 4

Loads, Dynamics/Vibrations, Acoustics - 83

Prospects of Structural Health Monitoring Systems - 87

The Ground Loads During Phases of Rolling: The Civilian and Military Specifications - 85

Thermal Loads and Protection Systems for Transitional and Shock Interaction Regions in Hypersonic Vehicle Design - 88

Training of Test Pilots: To Ventilate High Pressure Under A Load Factor - 301

LONG TERM EFFECTS

Ageing Aircraft - 96

Ageing Engines - 120

Effect of loading direction and long-term aging on fatigue-crack growth in Al-Li alloy 2090 - 163

LONGITUDINAL CONTROL

Pilot Induced Oscillations - 26

LONGITUDINAL STABILITY

Unified criteria for ACT aircraft longitudinal dynamics - 58

LORAN

Measurements of GPS and LORAN Performance in an Urban Environment - 42

LORAN C

Measurements of GPS and LORAN Performance in an Urban Environment - 42

LOSSES

A Model for Estimating Electromagnetic Wave Attenuation in a Forest (EWAF) Environment - 210

Atmospheric Path Loss and Scintillations Affecting Communications in the EHF Frequency Range - 210

Stator-Rotor-Stator Interaction in an Axial Flow Turbine and Its Influence on Loss Mechanisms - 111

Surviving a Helicopter Ditching: An Engineering challenge - 36

LOUDNESS

Active Hearing Protectors: New Developments and Measurement Procedures - 336

LOW ALTITUDE

A helmet mounted display for night missions at low altitude - 97

Advanced gust management systems: Lessons learned and perspectives - 123

Automatic Alerting System to Counter Low and Very Low Altitude Antiship Missiles - 364

Direct Measurement of Microwave Propagation Effects - 218

Flight test of a low-altitude helicopter guidance system with obstacle avoidance capability - 37

Helicopter HF communications using the NVIS mode - 194

Low-Level and Nap-of-the-Earth (NOE) night operations - 28

Piloted Simulation in Low Altitude, High Speed Mission Training and Rehearsal - 134

Tactical low-level helicopter communications - 194

LOW ASPECT RATIO WINGS

Experimental Analysis of the Vortex Wake Structure behind a Propeller-Wing Configuration - 15

Flowfield Prediction of Three-Dimensional Wing Trailing Vortices using Advanced Turbulence Models - 13

LOW COST

Low Cost Manufacturing - 193

Low Cost Multi-Sensor Suites for Surveillance and Weapon Guidance - 223

RAH-66 Comanche Program Status - 82

LOW EARTH ORBITS

Aerossist Key to Returning From Space and the Case for AFE - 153

LOW NOISE

Acoustic design of rotor blades using a genetic algorithm - 3

LOW PRESSURE

Critical heat flux panel experiments - 239

LOW REYNOLDS NUMBER

Stall hysteresis and 3D effects on stall regulated wind turbines: Experiment and modelling - 9

LOW SPEED

Aerodynamic Design of a Civil-Aeronautical Low Speed Large Wind Tunnel - 138

LOW SPEED WIND TUNNELS

Aerodynamic Design of a Civil-Aeronautical Low Speed Large Wind Tunnel - 138

Application of PIV in the Large Low Speed Facility of DNW - 256

Development of PIV for Two and Three Component Velocity Measurements in a Large Low Speed Wind Tunnel - 145

General Design Aspects of Low Speed Wind Tunnels - 138

Model and Full Scale Investigations of the Low Frequency Vibration Phenomena of the DNW Open Jet - 142

Tip Leakage Loss Development in a Linear Turbine Cascade - 107

Turbulence and Noise Criteria and their Implementation in NWTC-Type Wind Tunnels - 142

LOWER ATMOSPHERE

Refractive variability during VOCAR 23 August to 3 September 1993 - 202

Using Remote Refractivity to Predict Tropospheric Refractivity from Measurements of Microwave Propagation - 218

LUBRICANTS

Thin Film Lubrication of Non-Smooth Surfaces - 270

Tribological Problems in Spacecrafts - 270

LUBRICATING OILS

High Temperature Tribology for Future Diesel Engines - 271

LUBRICATION

Advanced Solid Lubricant Coatings for Aerospace Systems - 166

EHD Analysis of a Roller/Inner Ring Contact in a Jet Engine Roller Bearing - 270

High Temperature Tribology for Future Diesel Engines - 271

Rolling Contact Testing of Vapor Phase Lubricants - 271

The Reliability of the Bearings of Small and Medium Turbines Being More and More Dependent on Tribology - 271

Thin Film Lubrication of Non-Smooth Surfaces - 270

Tribological Assessments and Concepts for an Oilfree Internal Combustion Engine - 271

Tribology for Aerospace Systems - 269

LUMINANCE

Extending the Range of Vision Testing: The Small Letter Contrast Test - 299

Simulated Visual Scenes: Which are the Critical Cues? - 325

LUMINESCENCE

Applications of Temperature and Pressure Sensitive Paints - 172

LUMINOUS INTENSITY

Applications of Temperature and Pressure Sensitive Paints - 172

PSP: Intensity and Lifetime Measurements for Steady and Nonsteady Flow - 260

LUNGS

Effect of hypoxia on arterial blood gases in subjects with lung dysfunction - 295

M**MACH NUMBER**

Advanced Computational Techniques for Hypersonic Propulsion - 248

Compressible Turbulent Boundary Layers - 248

Computational Modeling and Validation for Hypersonic Inlets - 74

Control and Mathematical Model of Transonic Wind Tunnels - 139

Dynamic stall control by variable airfoil camber - 8

MARAGING STEELS

- Specific features of corrosion behavior of stainless maraging steels for aerospace application - 163

MARINE ENVIRONMENTS

- A FLIR case study using the Electro-Optical Tactical Decision Aid (EOTDA) Mark 3 - 374

- Climatic mapping of refractivity parameters from radiosonde data - 203

- Multisensor data fusion for integrated maritime surveillance - 193

- Multispectral Remote Sensing of the Coastal Atmospheric Boundary Layer - 292

- Propagation Assessment in Coastal Environments - 199

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Structure, variability, and sensing of the coastal environment - 281

The use of electrochemical impedance spectroscopy to predict the corrosion of aluminum-lithium alloys in marine environments - 160

Using Remote Refractivity to Predict Tropospheric Refractivity from Measurements of Microwave Propagation - 218

MARINE METEOROLOGY

Aerosol maps made during MAPIP - 292

An Overview of EOPACE (Electrooptical Propagation Assessment in Coastal Environments), including In Situ and Remote Sensing Techniques - 283

High resolution meteorological grid for clear air propagation modeling in northern coastal regions - 203

Lorient Campaign 1993: The Dutch contribution - 201

MM-Wave Airborne Cloud Radars - 218

Summary of the Marine Aerosol Properties and Thermal Imager Performance trial (MAPIP) organized by NATO AC/243 Panel 4/RSG.8 on Atmospheric Propagation Effects on Electro-Optical Systems, 11 October - 5 November 1993 - 293

Use of satellite imagery and other indicators to assess variability and climatology of oceanic elevated ducts - 202

MARINE PROPULSION

Active Combustion Control for Propulsion Systems - 161

MARKERS

Carbohydrate Deficient Transferrin: A New Marker to Evaluate Alcohol Consumption in Pilots - 299

MASERS

High-power microwave development in Russia - 238

Photoinjector-driven chirped-pulsed free electron maser - 268

MASS DISTRIBUTION

Mass Requirements for Helicopter Aircrew Helmets - 340

MASS FLOW

Development of an Off-Design Loss Model for Transonic Compressor Design - 107

Dynamic Response of a Cryogenic Lox Pump to Pressure and Massflow Fluctuation - 269

Sonic Nozzles for Mass Flow Measurement and Reference Nozzles for Thrust Verification - 249

MASS FLOW RATE

DIAL Measurements on a Gas Turbine Exhaust - 272

Prediction of Losses Due to the Tip Clearance Presence in Axial Flow Machines - 106

MASSIVELY PARALLEL PROCESSORS

On Improving Parallelism in the Transonic Unsteady Rotor Navier Stokes (TURNS) Code - 242

Parallel Implicit Upwind Methods for the Aerodynamics of Aerospace Vehicles - 12

MATCHING

Multisensor data fusion for integrated maritime surveillance - 193

MATERIALS HANDLING

Propellant handling provisions at a test facility for hypergolic bipropellant rocket engines - 178

MATERIALS RECOVERY

A complete resource recovery system for solid rocket propellants - 176

Critical fluid demilitarization and ingredient reclamation technology - 176

Destruction of solid propellant rocket motors with recuperation of energetic materials - 176

Environmental Aspects of Rocket and Gun Propulsion - 172

Reclaimed and virgin ammonium perchlorate variations and how they affect solid propellant properties - 176

Recycling military energetic materials into products for commercial explosive applications - 177

MATHEMATICAL MODELS

A concept for the evaluation of MSD based on probabilistic assumptions - 275

A highly reliable, high performance open avionics architecture for real time Nap-of-the-Earth operations - 96

A Nonlinear Model for Landing Gear Shimmy with Applications to the McDonnell Douglas F/A-18A - 69

A Review of Aircraft Landing Gear Dynamics - 67

A Selection of Test Cases for the Validation of Large-Eddy Simulations of Turbulent Flows - 255

A Simple Model for the Aero-Hydrodynamics of Ekranoplans - 253

A unified unsteady aerodynamic module for aeroelastic and MDO applications - 24

Advances in Soft-Computing Technologies and Application in Mission Systems - 346

Aerodynamics for elastically oscillating wings using the virtual grid deformation method - 22

An Analytic Ray Tracing Model for HF Ionospheric Propagation - 209

Analysis and Control of the Flexible Dynamics of Landing Gear in the Presence of Antiskid Control Systems - 68

Application of linearized Euler Equations to the estimation of flotation - 22

Application of the ENS3DAE Euler/Navier-Stokes Aeroelastic method - 22

Architecture and implementation of a multi-sensor data fusion demonstration model within the real-time combat system of the Canadian Patrol Frigate - 352

Asymptotic Theories of Incompressible Water Entry - 254

Axial-Torsional, Thermomechanical Fatigue Behavior of Haynes 188 Superalloy - 165

Bond Coat Considerations for Thermal Barrier Coatings - 172

Burn Hazard in Aircraft Fires - 302

Calculated viscous and scale effects on transonic aeroelasticity - 22

Calspan experience of PIO and the effects of rate limiting - 28

CFD based corrections for linear aerodynamic methods - 23

Computer Simulation of Unsteady Supercavitating Flows - 254

Design and Analyses of Airframes - 75

Development of an Off-Design Loss Model for Transonic Compressor Design - 107

EHD Analysis of a Roller/Inner Ring Contact in a Jet Engine Roller Bearing - 270

Emergence of Cavitation Profile - 254

Enhancement of Aircraft Ground Handling Simulation Capability - 95

Experience with unsteady aerodynamics computation for Saab Aircraft - 24

Fast PE models for mixed environments - 281

Fast staggered algorithms for the solution of three-dimensional nonlinear aeroelastic problems - 350

Flutter prediction for complex configurations - 129

Forecast of the impulse noise of the engines at very short time of combustion - 176

Global Air Traffic Management (GATM) - 51

High-Power Microwaves Effects on Smart Electronic Weapon Systems - 232

Identification of terrain imagery with unstable reflectivity - 280

Joint Strike Fighter: Cost Modeling in the JSF - 379

Looking for the simple PIO model - 27

Modeling and numerical simulation of microwave pulse propagation in air breakdown environment - 197

Modeling Cavitation during Head Impact - 303

Modeling nonperfect reflection from the sea for range-dependent ducting conditions - 200

Modeling of Turbulent Near-Wall Shear Flow Properties - 252

New Sources of Geographic Data to Aid in Air-Ground Identification - 383

New Test Cell Design Methods Based on Integrated Usage of Calculated and Experimental Researches - 139

NLR-TU Delft experience in unsteady aerodynamics and aeroelastic simulation applications - 23

Numerical Unsteady Aerodynamic and Aeroelastic Simulation - 7

Optimal infrared detector configurations for air target detection - 373

Optimal Resolution of En Route Conflicts - 51

Optimization Techniques as Available for On-Line Operations - 50

Rotorcraft system identification: An overview of AGARD FVP Working Group 18 - 2

SIMEN: An In-House Simulation Tool, Reducing Risk and Cost for the NSM Development Program - 379

Simulation models for IFF system performance analysis - 42

Some Problems of the Supercavitation Theory for Sub or Supersonic Motion in Water - 254

Stability of Supercavitating Slender Body During Water Entry and Underwater Motion - 254

Stall Inception and Surge in High-Speed Axial Flow Compressors - 109

Statistical property of widespread fatigue damage - 274

Structural verification of the Space Station Freedom Force Moment Sensor (FMS) using finite element modelling techniques and qualification testing - 149

Tactical low-level helicopter communications - 194

Technology Requirement to Implement Improved Situation Awareness: Machine Perception - 355

Terrain and refractivity effects in a coastal environment - 199

The effect of proof pressure testing on the retardation of multi-site damage - 63

The numerical modelling of near-field HPM target coupling - 198

The Role of Evacuation Modelling in the Development of Safer Air Travel - 330

Tissue Level Injury Criteria using Brain Finite Element Analysis, Bilateral Impact Model - 304

Topology Optimisation of 3D Linear Elastic Structures - 278

Transonic aeroelastic simulation of a flexible wing section - 23

Turbulent Boundary Layer over a Compliant Surface - 251

Use of Object Oriented Programming to Simulate Human Behavior in Emergency Evacuation of an Aircraft's Passenger Cabin - 330

Using a Red Team to devise countermeasures - 194

Using Mathematical Models to Predict the Development of Aircraft Cabin Fires - 32

Verification of the Swanson Nonlinear Thermo-Viscoelastic Model Using Stress Gage Technology - 183

Vibrational Analysis of Engine Components Using Neural-Net Processing and Electronic Holography - 355

CF-18 Flight Flutter Test (FFT) techniques - 65
Parameter estimation methods for flight flutter testing - 65
- MODELS**
- 331
A Designer's Guide to Human Performance Modelling - 342
A Radical New Way of Product Development: Exploring the Benefits with Virtual Reality in Virtual Concept - 350
A weather forecast utility model for military missions - 293
Balancing Modeling and Simulation With Flight Test in Military Aircraft Development - 92
- Cryogenic Model Systems - 135
In Vivo Mechanical Thresholds for Traumatic Axonal Damage - 303
Modelling of Thermomechanical Fatigue Including Phase Transformations - 277
Modelling the Thermal Conductivity of Thermal Barrier Coatings - 171
Worked Example of the Oracle Target Acquisition Model - 332
Worked Example of the use of IPME in the Evaluation of System Effectiveness - 332
- MODEMS**
New Technologies to Improve HF Modems Performance for Standardized Waveforms - 212
Testing HF-Modems: DSP's Open New Possibilities and Make New Demands on Real-Time HF-Simulators - 215
- MODULARITY**
A Discussion of a Modular Unmanned Demonstration Air Vehicle - 91
A Modular Scalable Signal Processor Architecture for Radar and EW Applications - 100
A Survey of Advanced Information Processing (AIP) Technology Areas for Crew Assistant System Development - 346
Advanced Avionics Architectures: Where are We Going? - 98
Capricornio Launcher: An Approach to a Modular and Low Cost Software Architectural Design - 147
Integrated Processing - 100
Integrated vehicle management systems - 72
- MODULUS OF ELASTICITY**
Methods and Kinetic Models for the Lifetime Assessment of Solid Propellants - 179
- MOISTURE**
Bonded composite repair of thin metallic materials: Variable load amplitude and temperature cycling effects - 54
Cryogenic Engineering and Materials - 190
Ensuring composite structure strength - 157
- MOLECULAR FLOW**
Molecular Diagnostics for Rarefied Flows - 257
- MOLECULAR SPECTROSCOPY**
Optical Measurements of Surface Pressure and Temperature in Turbomachinery - 375
- MOLTEN SALTS**
Destruction of propellant wastes using molten salt oxidation - 176
- MOLYBDENUM OXIDES**
Life Time Assessment and Stability of AN/GAP Propellants - 180
- MONTE CARLO METHOD**
A concept for the evaluation of MSD based on probabilistic assumptions - 275
A Flexibly Configurable Statistical Channel Model for Mobile Radio Systems With Directional Diversity - 215
Analysis of Propagation Effects and Non-Linear Distortions on Digital Modulation Schemes - 214
Monte Carlo Simulation Studies of Unguided and Guided Missiles Based on Probabilistic Modelling of Aerodynamic Coefficients - 18
Monte Carlo-Based Stochastic Finite Element Method: A New Approach for Structural Design - 75
Optimal infrared detector configurations for air target detection - 373
Rarefied Flows of Planetary Entry Capsules - 19
- MOODS**
Sustaining Helicopter Pilot Alertness With Dextro-drine (R) During Sustained Operations - 300
- MORPHOLOGY**
Data Fusion for Long Range Target Acquisition - 384

OBSERVABILITY (SYSTEMS)

The Fusion of an IR Search and Track With Existing Sensors to Provide a Tracking System for Low Observability Targets - 221

OBSERVATION

Observations of Doppler Spreading and FSK Signalling Errors on HF Signals Propagating Over High Latitude Paths - 211

OBSTACLE AVOIDANCE

A tactical navigation and routing system for low-level flight - 360
Development and flight testing of an Obstacle Avoidance System for US Army helicopters - 29
Flight test of a low-altitude helicopter guidance system with obstacle avoidance capability - 37
Landmark Navigation and Autonomous Landing Approach with Obstacle Detection for Aircraft - 53

OCCUPATIONAL DISEASES

Aircraft Noise Profiles and the Efficiency of Noise Protection Devices in the Royal Danish Air Force - 339

OCEAN CURRENTS

TOPEX Poseidon Follow-On Radar Altimeter Design and Development Status - 294

OCEAN SURFACE

Aerosol profiles near the sea surface during MAPTIP - 292
Climatic mapping of refractivity parameters from radiosonde data - 203
Comparison of simultaneous 3-5 and 8-12 micro transmission measurements near the ocean surface - 200
Lorient Campaign 1993: The Dutch contribution - 201
Modelling nonperfect reflection from the sea for range-dependent ducting conditions - 200
Modeling the vertical profiles of the index of refraction and $(C(\text{sub } n))(\text{exp } 2)$ in marine atmosphere - 201
Overview of NATO/AC 243/Panel 3 activities concerning radiowave propagation in coastal environments - 201
Propagation Assessment in Coastal Environments - 199
Radar Backscatter Statistics from the Sea Surface: Implications of SIR-C/X-SAR Observations for Maritime Surveillance - 227
Radiance of the ocean horizon - 281
Refraction effects on EO system detection ranges in coastal environments - 200
Remote measurement of atmospheric refraction conditions in the coastal region - 291
Summary of the Marine Aerosol Properties and Thermal Imager Performance trial (MAPTIP) organized by NATO AC/243 Panel 4/RSG.8 on Atmospheric Propagation Effects on Electro-Optical Systems, 11 October - 5 November 1993 - 293
Surface layer turbulence and aerosol profiles during MAPTIP - 292
Using Remote Refractivity to Predict Tropospheric Refractivity from Measurements of Microwave Propagation - 218

OCEAN TEMPERATURE

Refraction effects on EO system detection ranges in coastal environments - 200

OCEANOGRAPHY

NATO Naval Exercises as Observed from Civilian Radar Satellites - 287

OCEANS

A FLIR case study using the Electro-Optical Tactical Decision Aid (EOTDA) Mark 3 - 374
Aerosol maps made during MAPTIP - 292
Comparison of simultaneous 3-5 and 8-12 micro transmission measurements near the ocean surface - 200
Propagation Assessment in Coastal Environments - 199
Radiance of the ocean horizon - 281

Use of satellite imagery and other indicators to assess variability and climatology of oceanic elevated ducts - 202

OILS

Application of Oil Film Interferometry Skin-Friction to Large Wind Tunnels - 258

OMEGA NAVIGATION SYSTEM

An overview of Omega radio navigation system - 40

ON-LINE SYSTEMS

ARTAS: Multisensor Tracking in an ATC Environment - 234
Optimization Techniques as Available for On-Line Operations - 50
Use of Contextual Information in Multiple Sensor Tracking - 384

ONBOARD DATA PROCESSING

Landmark Navigation and Autonomous Landing Approach with Obstacle Detection for Aircraft - 53
Layered Fault Tolerant Architecture to Support Context-Sensitive Reasoning for Lethal Unmanned Aerial Vehicle Application - 350
Rapid Targeting and Real-Time Response: The Critical Links for Effective Use of Combined Intelligence Products in Combat Operations - 365
Spacecraft Attitude and Orbit Control Systems testing - 151

ONBOARD EQUIPMENT

Design considerations for a suboptimal Kalman filter - 237
Future Space Transportation Systems and their Potential Contribution to the NATO Mission - 148
Spacecraft navigation requirements - 148

ONE DIMENSIONAL FLOW

Structural/Ballistic Instability Ageout Mechanism in the Sparrow Mark 52 SRM - 153

OPERATING COSTS

Global Navigation Satellite Systems - 43
The Benefits of the Passive and Active Aeroelastic Design of Aircraft Structures - 90

OPERATING TEMPERATURE

Advanced Processing of TBC's for Reduced Thermal Conductivity - 169

OPERATIONAL PROBLEMS

Operational Determinants of Medical Planning - 311
Operational effectiveness through interoperability - 361

OPERATIONS RESEARCH

A Designer's Guide to Human Performance Modelling - 342
Aeromedical Support Issues in Contingency Operations - 307
C3I: War game and technical-operational simulation - 344
Global Air Traffic Management (GATM) - 51
The Role of Linear Acceleration in Visual-Vestibular Interactions and Implications in Aircraft Operations - 321

OPERATOR PERFORMANCE

Investigation of Human Performance Monitoring an IR-Camera View from an Unmanned Tactical Aircraft - 342

OPERATORS (PERSONNEL)

Intelligent Decision Aids for Human Operators - 377

OPTICAL COMMUNICATION

Optogeometrical Characterisation of Erbium Doped Fibres - 211
Ultra-fast nonlinearities in semiconductor optical amplifiers for applications in all-optical networks - 374

OPTICAL COMPUTERS

Impact of optics on computing systems: From Optical Interconnects to dedicated optoelectronic machines - 344

Optical Processing and Computing - 343

Optics and nonlinear optics for signal processing and computing applications - 374

Parallel accessed optical storage - 344

OPTICAL COUNTERMEASURES

DIFCM: An Effective Technology for Aircraft Self Protection Against Optoelectronic Missile Seekers - 97

Precision Pointing and Tracking for Targeting/Fire Control - 237

OPTICAL COUPLING

Impact of optics on computing systems: From Optical interconnects to dedicated optoelectronic machines - 344

OPTICAL DATA PROCESSING

Advanced Information Processing and Display Technologies - 102

Image Data Management for Tactical Unmanned Airborne Surveillance - 386

Impact of optics on computing systems: From Optical interconnects to dedicated optoelectronic machines - 344

Optical Processing and Computing - 343

Optics and nonlinear optics for signal processing and computing applications - 374

The emerging field of artificial neural networks and their optoelectronic implementations - 353

OPTICAL DATA STORAGE MATERIALS

Parallel accessed optical storage - 344

OPTICAL DISKS

The emerging field of artificial neural networks and their optoelectronic implementations - 353

OPTICAL EQUIPMENT

Experience acquired by Aerospatiale in the field of the integration of high resolution optical payloads - 373

OPTICAL FIBERS

Error Probability Computation in Optical Fiber Links - 215

OPTICAL FLOW (IMAGE ANALYSIS)

Review of Optical Methods for Fluid Dynamics - 256

OPTICAL MEASUREMENT

Advanced Non-Intrusive Instrumentation for Propulsion Engines - 192

Fire Safety Concept for a Modern Combat Aircraft - 33

Optical Measurements of Surface Pressure and Temperature in Turbomachinery - 375

PSP: Intensity and Lifetime Measurements for Steady and Nonsteady Flow - 260

Review of Optical Methods for Fluid Dynamics - 256

The Two-Component PSP Investigation on a Civil Aircraft Model in S2MA Wind Tunnel - 25

Virtual Manufacturing: From Optical Measurement to Rapid Prototyping - 348

OPTICAL MEASURING INSTRUMENTS

A Quantitative 2D Density Measuring System Using UV Rayleigh Scattering at an Atmospheric Wind Tunnel - 145

Emission spectroscopy and pyrometry of propellant flames and solid rocket exhaust products - 153

HeliRadar: A rotating antenna synthetic aperture radar for helicopter allweather operations - 195

Introduction of Beryllium Aluminum Castings in the RAH-66 Comanche EOSS Program - 81

Laser-2-Focus Measurements on a Turbine Cascade with Leading Edge Film Cooling - 260

Optical Blade Vibration Measurement at MTU - 375

Optical Diagnostics for Cryogenic Liquid Propellants Combustion - 162

Using the Laser Light Sheet Technique in Combustion Research - 162

The Need for Precision-Guided Munitions in Limited Conflict: An Operational Viewpoint - 361

ORGANIC MATERIALS

Organic coating technology for the protection of aircraft against corrosion - 166

The Fusion of Organic and Non-Organic Identity Information Sources Using Evidential Reasoning - 385

ORGANIZATIONS

Reorganisation of Evaluation and research to Support Future Defence Procurement - 381

ORGANIZING

Reorganisation of Evaluation and research to Support Future Defence Procurement - 381

Reorganization of the General Weapons Directorate (DGS) in France - 381

ORIFICES

Tip Vortex Roll-up and Cavitation in Water and Polymer Solutions - 255

OSCILLATING FLOW

Aerodynamics for elastically oscillating wings using the virtual grid deformation method - 22

Non-Linear Nonsteady Effects in the Hydrodynamics of the Oscillating Wing - 21

Parametric Identification of Transonic Unsteady Flow Characteristics for Predicting Flutter of Fighter Aircraft With External Stores - 126

The Simultaneous Measurements of Velocity, Pressure, Temperature, and Heat Release in an Oscillating Flame - 161

OSCILLATION DAMPERS

Blunt Bodies Dynamic Derivatives - 20

OSCILLATIONS

Self-Induced Oscillations of Landing Gear as an Integral Landing Gear Aircraft System Problem - 68

OSCILLATORS

High-power microwave development in Russia - 238

Photoinjector-driven chirped-pulsed free electron maser - 268

OVER-THE-HORIZON RADAR

Nostramarine: A Concept of Multistatic Detection Adjusted to Surveillance of Low Altitude Targets - 262

OXIDATION

Bond Coat Considerations for Thermal Barrier Coatings - 172

Destruction of propellant wastes using molten salt oxidation - 176

OXIDE FILMS

High Temperature - Thin Film Strain Gages Based on Alloys of Indium Tin Oxide - 267

OXIDES

Overcoats for the Improved Performance of PdCr High Temperature Thin Film Strain Gages - 267

OXIMETRY

An Integrated Medical Monitor for Aeromedical Use - 312

OXYGEN

Ageing and Life Prediction of Composite Propellant Motors - 179

Automatic Detection of Cerebral Hypoxia Using Frequency Domain Mapping and Neural Networks - 298

Extrapolation From Wind Tunnel to Flight: Shuttle Orbiter Aerodynamics - 26

Real Gas/Blunt Cone - 263

OXYGEN CONSUMPTION

Mechanical Ventilator Performance During Aeromedical Evacuation - 313

OXYGEN MASKS

Advanced Oxygen Systems for Aircraft - 335

Positive pressure breathing for G protection (PBG) - 334

OXYGEN SUPPLY EQUIPMENT

Advanced Hybrid Oxygen System-Medical - 313

OZONE DEPLETION

Clean propellants for space launch boosters - 173

Environmental Perspectives from a Canadian Aerospace Company - 290

Finding an environmentally acceptable replacement for freon 114B2 (Halon 2402) that meets minuteran LITVC performance criteria - 178

Surface Treatments and the Environment: Impact of Regulations on the Policies of the Aerospace Industries - 291

The impact of space rocket launches on the earth ozone layer - 289

P**PACKET SWITCHING**

A Multiservice Switch for Advanced Avionics Data Networks - 99

PACKET TRANSMISSION

Link Level Protocols for Radio Channels - 214

PACKETS (COMMUNICATION)

A Multiservice Switch for Advanced Avionics Data Networks - 99

PAINTS

Applications of Temperature and Pressure Sensitive Paints - 172

Aquastrip - 189

Background to plastic media blasting - 188

Bioremediation of wheat starch media waste - 288

Dry media blasting with wheat starch - 188

Environmentally Safe and Effective Processes for Paint Removal - 188

Low-Speed Flow Studies Using the Pressure Sensitive Paint Technique - 25

Operational parameters and material effects - 189

Optical Measurements of Surface Pressure and Temperature in Turbomachinery - 375

Overview of paint removal methods - 188

Paint removal and surface cleaning using ice particles - 189

Paint removal principles - 188

Process evaluation - 190

PSP: Intensity and Lifetime Measurements for Steady and Nonsteady Flow - 260

Qualification of Chromate-Free Primers for Application to Aircraft Structure - 168

Rotor Blade Pressure Measurement in a Rotating Machinery Using Pressure and Temperature Sensitive Paints - 260

Selective chemical stripping - 189

Standardization work - 190

Stripping by laser - 267

Stripping with dry ice - 189

Surface Temperature Measurement in Turbines - 266

Treatment of plastic media waste - 288

Water blasting paint removal methods - 189

PALLADIUM COMPOUNDS

Overcoats for the Improved Performance of PdCr High Temperature Thin Film Strain Gages - 267

PANEL METHOD (FLUID DYNAMICS)

Aeroacoustic calculation of helicopter rotors at DLR - 371

Computational and Experimental Investigation of the Wakes Shed from Flapping Airfoils and their Wake Interference/Impingement Characteristics - 17

Three-D Euler calculations of multibladed rotors in hover: Investigation of the wake capturing properties - 10

PANELS

Fracture analysis of stiffened panels under biaxial loading with widespread cracking - 275

PIGMENTS

Treatment of plastic media waste - 288

PILOT ERROR

Human Reliability Assessment Tools: PHRASE 2 - 342

PILOT INDUCED OSCILLATION

Aeroelastic pilot-in-the-loop oscillations - 28

An Investigation of pilot induced oscillation phenomena in digital-flight control systems - 124

Calspan experience of PIO and the effects of rate limiting - 28

Looking for the simple PIO model - 27

Observations on PIO - 27

Pilot Induced Oscillation: A report on the AGARD Workshop on PIO - 125

Pilot Induced Oscillations - 26

PIO: A historical perspective - 26

Rotorcraft-Pilot Coupling: A Critical Issue for Highly Augmented Helicopters? - 336

SAAB experience with PIO - 28

SCARLET: DLR rate saturation flight experiment - 27

The prevention of PIO by design - 121

The process for addressing the challenges of aircraft pilot coupling - 27

The role of handling qualities specifications in flight control system design - 121

Unified criteria for ACT aircraft longitudinal dynamics - 58

PILOT PERFORMANCE

Aircrew Performance During Extended Simulated Bomber Missions - 307

An Investigation of Primary Flight Control Failure in a Piloted Helicopter - 79

Analysis of Psychomotor Performance of Fighter Pilots During Flight - 327

Aviator's Grounding Time After Melatonin Administration During Rapid Deployment Missions - 310

Current Status and Future Developments of RAF Aircrew Selection - 327

Designing Novel Head-Up Displays to Promote Situational Awareness - 335

Determinants of Situational Awareness in US Air Force F-15 Pilots - 318

Development of Criterion Measures of Situation Awareness for Use in Operational Fighter Squadrons - 319

Evasive Maneuvers and High-G Flight Safety After Sleep Deprivation - 308

Flying Training - Past Achievements and Future Challenges - 327

Human Reliability Assessment Tools: PHRASE 2 - 342

Looking for the simple PIO model - 27

Performance and Workload Measurement in Simulation-Based Training - 328

PIO: A historical perspective - 26

Selection of Future Fighter Pilots - 327

Selection of Special Duty Aviators: Cognitive and Personality Findings - 328

SIRPH: Steerable infrared picture on helmet mounted display - 333

Situational Awareness Measurement in Cockpit Evaluation Trials - 319

Stick and Feel System Design - 127

The Efficacy of Dextroamphetamine for Sustaining Helicopter Pilot Performance: An In-Flight Evaluation - 309

Training of Aircrew Decision Making - 328

Understanding the Requirement: A Review of Common Problems in Training, Selection and Design - 328

PILOT PLANTS

Performance and Workload Measurement in Simulation-Based Training - 328

PILOT SELECTION

Advances in USAF Pilot Selection - 326

Assessment of Anthropometric Accommodation in Aircraft Cockpits and Pilot Body Size Selection Criteria - 335

Characteristics of Female and Male USAF Pilots: Selection and Training Implications - 326

Current Status and Future Developments of RAF Aircrew Selection - 327

Selection and special physiological training of flying personnel to high +G(z)-maneuverable flights-main concept - 316

Selection and training of MiG-29 and future fighter pilots - 317

Selection of Future Fighter Pilots - 327

Selection of Special Duty Aviators: Cognitive and Personality Findings - 328

Simulator Based Test Systems as a Measure to Improve the Prognostic Value of Aircrew Selection - 328

The Analysis of Safety Indicators in the Aviators' Training - 326

The Canadian Automated Pilot Selection System (CAPSS): Validation and Cross Validation Results - 326

Training of Aircrew Decision Making - 328

Understanding the Requirement: A Review of Common Problems in Training, Selection and Design - 328

PILOT SUPPORT SYSTEMS

Enhancement of Aircraft Ground Handling Simulation Capability - 95

Integration of Technologies for Closed Cockpits - 342

PILOT TRAINING

Advances in USAF Pilot Selection - 326

Analysis of Psychomotor Performance of Fighter Pilots During Flight - 327

Characteristics of Female and Male USAF Pilots: Selection and Training Implications - 326

Current Status and Future Developments of RAF Aircrew Selection - 327

Development of Techniques to Identify Individuals with Superior Potential for Situational Awareness - 318

Flight Simulation: Where are the Challenges? - 130

Flying Training - Past Achievements and Future Challenges - 327

Loss of Aviation Situation Awareness in the Canadian Forces - 317

Mission Planning Systems: Cubic Multipliers - 366

Performance and Workload Measurement in Simulation-Based Training - 328

Pilot Testing in Virtual Environments - 95

R and D Advances in USAF Pilot Training - 328

Selection and special physiological training of flying personnel to high +G(z)-maneuverable flights-main concept - 316

Selection and training of MiG-29 and future fighter pilots - 317

Selection of Future Fighter Pilots - 327

Selection of Special Duty Aviators: Cognitive and Personality Findings - 328

Simulator Based Test Systems as a Measure to Improve the Prognostic Value of Aircrew Selection - 328

PILOTLESS AIRCRAFT

Aerodynamics of the ARMOR X7 UAV - 18
 Aerospace 2020, 5, 145 - 366
 An Exploratory Study of the Human-Machine Interface for Controlling Maritime Unmanned Air Vehicles - 336
 ARMOR Project: Autonomous Flight Capability - 364
 Automatic Alerting System to Counter Low and Very Low Altitude Antiship Missiles - 364
 Automatic flight control system for an unmanned helicopter system design and flight test results - 123
 Autonomous Navigation and Control Functions of the CL-327 VTOL UAV - 129
 Autopilot Synthesis for Unmanned Tactical Air Vehicles (UTAV) - 129
 CONOPS of HALE UTA in an Infrared Early Warning Mission for Theater Missiles Defense - 368
 CRECERELLE: A New Generation System of Quick Remote Control for Reconnaissance, Surveillance and Acquisition of Objectives - 364
 Design Considerations for Future Uninhabited Combat Air Vehicles - 7
 Design Guidelines and Considerations for the UTA - 94
 Emerging Military Unmanned Air Vehicle System Concepts - 93
 Enabling Technology for UAVs - 77
 From Manned to Unmanned: A Viable Alternative to the Scrapyard - 368
 High Performance Data Link for Unmanned Air Vehicles - 224
 Highly Maneuverable Lethal Vehicle (HMLV) Concept - 94
 Information Correlation/Fusion - 366
 Integrated Data Link for UTA Applications: Design Considerations and Development Results - 236
 Operational Concepts for Uninhabited Tactical Aircraft - 369
 PREDATOR: Medium Altitude Endurance - 365
 Reliable Autonomous Precise Integrated Navigation RAPIN for Present and Future Air-Vehicles - 52
 Sensor Alternatives for Future Unmanned Tactical Aircraft - 102
 Small Effective Air-to-Surface Munitions for Unmanned Tactical Aircraft Applications - 192
 Subsystem Integration for Tactical Missiles (SITM) and Design and Operation of Unmanned Air Vehicles (DOUAV) - 3
 System Design Considerations for Unmanned Tactical Aircraft (UTA) - 7
 System Integrity Considerations for Unmanned Tactical Aircraft - 94
 System Layout of an Unmanned High Altitude Aircraft for Certification and Flight in Civil Airspace - 95
 The Challenge of UAV Supporting Offensive Air Operations - 369
 The Future for UAVs in NATO - 363
 The MARVEL Maritime UAV - 77
 The Operational Effectiveness of UCAVs in Mobile Target Attack - 368
 The Role of Unmanned Tactical Aircraft in the Battlefield Surveillance - 368
 Unconstrained Maneuver Air Vehicle: A Configuration Development - 94
 Unmanned Tactical Air Vehicles: An Electronic Combat Perspective - 369
 Unmanned Tactical Aircraft: A Lockheed Martin Perspective - 77

Unmanned Tactical Aircraft: A Radically New Tactical Air Vehicle and Mission Concept - 87

PILOTS

Cockpit Usability - A Design Checklist - 341
 Zolpidem, Sleepiness and the Psychomotor Capacities of Ground Personnel and Pilots - 310

PILOTS (PERSONNEL)

Arc Segment Attitude Reference (ASAR): Simulator Application During the Development Process of a New Attitude Reference Symbology - 132
 Echocardiography in NATO Aircrew: A Multi-National Study - 301
 Evaluation of Transport Helicopter Piloting Capacity, Using In-Flight Tests of the ADS-33C Type: Formal Establishment of the Test Methodology and Instrumentation - 79
 Simulated Visual Scenes: Which are the Critical Cues? - 325
 The Audio Environment in Aircraft - 224

PINS

Three-Dimensional Progressive Failure Analysis of Pin/Bolt Loaded Composite Laminates - 279

PIPE FLOW

A Selection of Test Cases for the Validation of Large-Eddy Simulations of Turbulent Flows - 255

PITCH (INCLINATION)

Flight demonstration of an advanced pitch control law in the VAAC Harrier aircraft - 124

PITCHING MOMENTS

Computational fluid dynamics development and validation at Bell Helicopter - 239
 Extrapolation From Wind Tunnel to Flight: Shuttle Orbiter Aerodynamics - 26

PITTING

Eddy current detection of pitting corrosion around fastener holes - 274

PIVOTS

Status of bonded boron/epoxy doublers for military and commercial aircraft structures - 54

PIXELS

Pixel Fusion for Roads Detection and Classification - 385
 Pixelless Infrared Imaging Using Quantum Wells - 376

PLANE WAVES

Coupling measurements on intelligent missiles at microwave frequencies - 196
 Radar Reflectivity of a Target Illuminated by a Spherical Wave - 229
 Susceptibility Measurements on GPS Receivers - 43

PLANETARY ATMOSPHERES

Planetary Atmospheres, Basic Thermodynamics and Regimes - 387

PLANING

C-17 Enhancements to a Flight Test Planning Program - 91

PLANNING

Functional analysis/decomposition of closed-loop, real-time work processes - 353
 Structures, architectures and design principles for dynamic planning functions in ATM - 42

PLASMA DISPLAY DEVICES

High-power microwave development in Russia - 238

PLASMA PROPULSION

Tests of engines have stationary plasma in simulated space environment - 153

PLASMA SHEATHS

Communication Blackout During Earth-Atmosphere Entry of Capsules - 224

PLASMA SPRAYING

Advantages/Disadvantages of Various TBC Systems as Perceived by the Engine Manufacturer - 172

In-Flight Particle Diagnostics for On-Line Process Control During Deposition of Plasma-Sprayed TBCs - 169

Microstructure and Thermal Conductivity of Layered Thermal Barrier Coatings Processed by Plasma Spray and Physical Vapor Deposition Techniques - 171

Modelling the Thermal Conductivity of Thermal Barrier Coatings - 171

Recent Developments in Plasma Sprayed Thermal Barrier Coatings - 169

TBCs on Free-Standing Multilayer Components - 170

Thermal Barrier Coatings - 168

PLASMA-ELECTROMAGNETIC INTERACTION

A review of nonlinear electromagnetic propagation effects - 198

Spectral variation of high power microwave pulse propagating in a self-generated plasma - 198

The numerical modelling of near-field HPM target coupling - 198

PLASTIC DEFORMATION

Deformation and Failure Mechanisms of DS CM 247 LC Under TMF and LCF Loading - 277

Materials for Use in Cryogenic Wind Tunnels - 135

PLASTIC PROPERTIES

Materials for Use in Cryogenic Wind Tunnels - 135

PLASTICIZERS

Development of less polluting propellants - 173

Gas pollutants from ammonium nitrate based propellants - 175

Life Time Assessment and Stability of AN/GAP Propellants - 180

LOVA Propellant Aging: Effect of Residual Solvent - 182

Use of new oxidizers and binders to meet clean air requirements - 175

PLASTICS

Background to plastic media blasting - 188

Facilities used for plastic media blasting - 129

Treatment of plastic media waste - 288

PLATES (STRUCTURAL MEMBERS)

Stress Analysis of Open and Fastener Hole Composites Based on Three-Dimensional Spline Variational Technique - 279

PLENUM CHAMBERS

Elaboration of Cryogenic Transonic Short-Duration Wind Tunnel at ITAM - 140

Evaluating Analytically and Experimentally the Gas Dynamics of Transonic Wind Tunnels with Devices for Air Evacuation from Plenum Chamber - 141

PLUMES

Application of Laser-Induced Fluorescence (LIF) to Liquid-Propellant Rocket Engine Testing - 154

PODS (EXTERNAL STORES)

Combination of New Generation Optronic Sensors for Navigation and Attack Systems - 362

POINT SOURCES

Optimal infrared detector configurations for air target detection - 373

POINT SPREAD FUNCTIONS

Optimal infrared detector configurations for air target detection - 373

POINTING CONTROL SYSTEMS

Acquisition, tracking, pointing and fire control for Ballistic Missile Defense - 187

Guidance and Control for Futura Air-Defence Systems - 186

Spacecraft deployable structure testing - 149

The High Altitude Balloon Experiment demonstration of acquisition, tracking, and pointing technologies (HABE-ATP) - 187

Initiation and Propagation of Flow Instabilities in Multi-Stage Axial Compressors - 110

Rotor-Stator Interaction in High-Speed Axial Compressor - 111

PRESSURE SUITS

Anti-G suits - 355

PRESSURIZED CABINS

Effect of hypoxia on arterial blood gases in subjects with lung dysfunction - 295

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

PRESSURIZING

Anti-G suits - 355

PRESTRESSING

An Investigation on a Bolted-Cold Bonded Joint for Large Diameter Structures - 280

Repair/Refurbishment of Military Aircraft - 87

PRETREATMENT

Advanced Surface Preparation for Metal Alloys - 168

Overview of Cleaning/Surface Preparation for Metals in the US - 290

Phosphoric Sulfuric Acid Anodizing (PSA): A Heavy Metal Free Alternative for High Quality Surface Pretreatment of Aluminium - 191

Research into Chromate-Free Treatments for the Protection of Aluminium Alloys - 168

PREVENTION

A Worldwide Epidemiological Survey on the Infrastructure for Prevention of Communicable Diseases in the Military - 314

Applications of Physical Analysis and Crash Survivability - 306

Casualty Care for 2010 and Beyond - 311

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications - 306

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications: General Concepts and Objectives - 37

Neurological Influence in Push-Pull Effect - 297

Prevention of HIV Infection and Sexually-Transmitted Diseases in Contingency and Peace-keeping Operations - 314

The Analysis of Safety Indicators in the Aviators' Training - 326

The Physical Basis of Impact Injury and its Prevention - 306

The Prevention of Aircraft Accidents Through the Collection and Analysis of Human Factor/Aero-medical Aircraft Accident Data - 36

The prevention of PIO by design - 121

PRIMERS (COATINGS)

Environmentally Compliant Surface Treatments of Materials for Aerospace Applications - 191

Organic coating technology for the protection of aircraft against corrosion - 166

Qualification of Chromate-Free Primers for Application to Aircraft Structure - 168

PRINCIPAL COMPONENTS ANALYSIS

Development of Criterion Measures of Situation Awareness for Use in Operational Fighter Squadrons - 319

PRIORITIES

Priorities in Immunizations for Peacekeeping Forces - 314

PROBABILITY DENSITY FUNCTIONS

Analysis of Propagation Effects and Non-Linear Distortions on Digital Modulation Schemes - 214

PROBABILITY DISTRIBUTION FUNCTIONS

Monte Carlo-Based Stochastic Finite Element Method: A New Approach for Structural Design - 75

PROBABILITY THEORY

A concept for the evaluation of MSD based on probabilistic assumptions - 275

An Impulse Response Measurement System and Some Experimental Results from a Forward Scatter Meteor Burst Link - 216

Benchmarking ATR Test Data - 383

Decision tool for optimal deployment of radar systems - 205

Multiple hypothesis tracking versus Kalman filter with nearest neighbor correlation. Performance comparison - 205

Risk analysis in the presence of corrosion damage - 62

Risk assessment of an aging military trainer aircraft - 62

Trends and Tendencies in LPI Radar - 207

PROBLEM SOLVING

Intelligent Decision Aids for Human Operators - 377

Training of Aircrew Decision Making - 328

PROCEDURES

An overview of DOD test requirements for launch and space systems - 149

Computational Assessment on Integrated Analysis and Design - 76

Development of Correction Procedure for Signals of Cryogenic Balances - 136

Operationally Representative Testing of Modern Tactical Weapons - 363

Simulation, Distributed Simulation, and Synthetic Environments. Future Applications and Challenges - 133

Tailoring test requirements for application in multinational programmes - 387

Trauma Surgery for Contingency Operations: Test Based Improvements - 313

PROCESS CONTROL (INDUSTRY)

Prioritization methodology for chemical replacement - 177

PROCUREMENT

The Value of S and T in Affordability - 381

PRODUCT DEVELOPMENT

A Concurrent Engineering Product- Airbus Aircraft Technology - 75

A Radical New Way of Product Development: Exploring the Benefits with Virtual Reality in Virtual Concept - 350

Aircraft Design Integration and Affordability - 94

Compound Interest: A Dividend for the Future? - 82

Cost Engineering: A Feature Based Approach - 377

Development and flight testing of an Obstacle Avoidance System for US Army helicopters - 29

Development environment for knowledge-based systems. Some examples of application: The Copilote Electronique Project - 125

Inflatable Restraint Systems for Reducing Head Injury - 340

Joint Strike Fighter Manufacturing Demonstration (JMD): Integrating Design and Cost for an Affordable Weapon System - 349

Modern Fighter Mission Avionics: The Joint Strike Fighter Avionics Architecture - 101

Problems of predicting material property retention during long term service - 274

RAH-66 Comanche Program Status - 82

Seamless Transition From Product Concept to Production and Deployment - 350

Standards for Protective Helmets - 340

Studies and Simulations on Sensor Fusion and Cueing for Fighter Application - 223

The Integrated Development of a Medium Lift Military/Civil Helicopter - 82

The Value of S and T in Affordability - 381

US Army Aircrew Helmets: Head Injury Mitigation Technology - 305

Virtual Product Definition: The Key to Affordable and Supportable Products - 347

PRODUCTION COSTS

Cost Engineering: A Feature Based Approach - 377

Lessons to be Drawn From the Civilian-Military Duality: Example of SAGEM Company - 378

Skunk Works Lessons Learned - 378

PRODUCTION MANAGEMENT

Agile Manufacturing: Mythology or Methodology? - 380

Lessons to be Drawn From the Civilian-Military Duality: Example of SAGEM Company - 378

PRODUCTION PLANNING

An Object-Oriented Taxonomy for Part and Process Design - 349

Virtual Manufacturing - 347

PRODUCTIVITY

An Overview of Test Capabilities at ETW - 136

PROGRAMMED INSTRUCTION

Selecting a Software Developer in a Specification Free Acquisition Environment - 346

PROGRAMMING (SCHEDULING)

Optimal Scheduling With Maximum Position Shift (MPS) Constraints: A Runway Scheduling Application - 51

PROGRAMMING LANGUAGES

Integration issues in modular mission management aid development - 188

Modelling and Simulation of Communication Systems - 233

PROJECT MANAGEMENT

CMT: An Innovative System for Project Risk Management - 380

Implementation of Airbus Concurrent Engineering - 348

Introduction to Flight Test Engineering - 61

Joint Strike Fighter: Cost Modeling in the JSF - 379

Past and Future Programmes: A View on Cost Management Evolution and Challenges - 380

PULSE COMMUNICATION

Modelling and Simulation of Communication Systems - 233

Tactical low-level helicopter communications - 194

PULSE COMPRESSION

Upgrading of the RF tubes of the present state of the art - 198

PULSE DURATION

Infrared and millimeter wave detection using thin films of Pb doped BiSrCaCuO superconductor - 263

Test laboratory for high level microwaves - 198

PULSE RADAR

Pulse Response of Three-Dimensional Military Targets Conception, Development and Check of a Measurement Bench - 230

PULSED LASER DEPOSITION

Advanced Hard Coatings and Wear Resistant Materials for Aerospace - 167

Advanced Solid Lubricant Coatings for Aerospace Systems - 166

PULSED LASERS

Infrared and millimeter wave detection using thin films of Pb doped BiSrCaCuO superconductor - 263

Photoinjector-driven chirped-pulsed free electron maser - 268

PULSEJET ENGINES

Pulse Detonation Wave Engine - 154

PUMPS

Tests of engines have stationary plasma in simulated space environment - 153

PYROMETERS

Effective Spectral Emissivity Measurements of Superalloys and YSZ Thermal Barrier Coating at High Temperature Using a 1.6 Micron Single Wavelength Pyrometer - 172

Emission spectroscopy and pyrometry of propellant flames and solid rocket exhaust products - 153

Q

Q FACTORS

Evaluation of High-Angle-of-Attack Handling Qualities for the X-31A Using Standard Evaluation Maneuvers - 128

Radial accelerometer: A new low-impedance HPM source - 199

QUADRATURE AMPLITUDE MODULATION

Analysis of Propagation Effects and Non-Linear Distortions on Digital Modulation Schemes - 214

QUADRUPOLES

Aeroacoustic calculation of helicopter rotors at DLR - 371

Calculation of high-speed noise from helicopter rotor using different descriptions of quadrupole source - 371

QUALIFICATIONS

Development of Criterion Measures of Situation Awareness for Use in Operational Fighter Squadrons - 319

Qualification by Analysis - A Framework for the Future - 377

Training of Future Fighter Pilots - 329

QUALITATIVE ANALYSIS

Investigations on Handling Qualities and Aerodynamic Characteristics of EUROFIGHTER 2000 at DAIMLER-BENZ AEROSPACE Flight Test Centre - 128

QUALITY CONTROL

Quality Assurance and Certification Procedures for Bonded Joints in On-Aircraft Scenarios - 275

Reliability and maintainability - 58

Tailoring test requirements for application in multinational programmes - 387

The development of an engineering standard for composite repairs - 58

QUANTITATIVE ANALYSIS

The Fusion of Organic and Non-Organic Identity Information Sources Using Evidential Reasoning - 385

QUANTUM WELLS

Pixelless Infrared Imaging Using Quantum Wells - 376

R

RADAR

F-16 System/Structural Upgrades - 86

Lorient Campaign 1993: The Dutch contribution - 201

Trends and Tendencies in LPI Radar - 207

RADAR ABSORBERS

Novel HF, Radar and IR Absorber Material - 230

RADAR ANTENNAS

Experimental Analysis of Effects of Anomalies in Structure of Radomes on Radome's Performance - 232

HeliRadar: A rotating antenna synthetic aperture radar for helicopter allweather operations - 195

RADAR CORNER REFLECTORS

Livorno 1996: The Centimetre and Millimetre Wave Radar Signature and Propagation Trial by NATO AC/243 (Panel 3/RSG.21) - 230

RADAR CROSS SECTIONS

Experimental Evaluation of Material Parameters for RCS Prediction Codes - 230

Fast Radar Cross Section (RCS) Computation via the Fast Multiple Method - 230

Low Frequency Scattering by Targets Above a Ground Plane - 229

Radar Signature Analysis and Imaging of Military Targets - 229

RCS Evaluations with Computational Electromagnetics - 229

RADAR DATA

Characterization of Natural Targets Using Multi-parametric SIR-C/X-SAR Imagery - 284

Diffusion of Microwaves by Non-Spherical and Inhomogeneous Hydrometers: Simulations, Observations, and Restorations during the TOGA-COARE Experiment - 283

Distance based range profile classification techniques for aircraft recognition by radar: A comparison on real radar data - 205

Investigations into sub-ns pulse generation using ferrite-loaded coaxial lines - 238

SHOCK LAYERS

Loss Mechanisms and Unsteady Flows in Turbomachines - 104

Radiative Heat Flux: Theoretical and Experimental Predictions for Titan Entry Probe - 20

Rotational and Vibrational Temperatures and Density Measurements by Coherent Anti-Stokes Raman Scattering in a Nonequilibrium Shock Layer Flow - 257

SHOCK TESTS

Shock sensitivity of ammonium nitrate based propellants - 174

SHOCK TUNNELS

Hypersonic aerodynamic/aerothermal test facilities available in Europe to support space vehicle design - 146

Real-Gas Aerothermodynamics Test Facilities - 26

Survey of Aerothermodynamics Facilities Useful for the Design of Hypersonic Vehicles Using Air-Breathing Propulsion - 144

SHOCK WAVE INTERACTION

A Selection of Test Cases for the Validation of Large-Eddy Simulations of Turbulent Flows - 255

Aerothermal Characteristics of Shock/Shock Interaction Regions in Hypersonic Flows - 20

Computational Modeling and Validation for Hypersonic Inlets - 74

External Hypersonic Aerodynamics: State-of-the-Art and Future Perspective - 20

Hypersonic Experimental and Computational Capability, Improvement and Validation - 11

Stage Separation Aerothermodynamics - 377

Thermal Loads and Protection Systems for Transitional and Shock Interaction Regions in Hypersonic Vehicle Design - 88

Viscous/Inviscid and Real-Gas Effects Associated with Hypersonic Vehicles - 248

SHOCK WAVE PROFILES

Loss Prediction on Axial Flow Cascades Using a Navier-Stokes Solver - 108

SHOCK WAVE PROPAGATION

Forecast of the impulse noise of the engines at very short time of combustion - 176

Investigations Into sub-ns pulse generation using ferrite-loaded coaxial lines - 238

SHOCK WAVES

Cascade Simulation of Multiple Shock Passing From Upstream Blade Rows - 112

Data Base for CFD Validation - 19

Forecast of the impulse noise of the engines at very short time of combustion - 176

Shear Sensitive Liquid Crystals in Subsonic and Transonic Wind Tunnel Testing - 259

Shock Wave Boundary Layer Interactions in High Mach Number Flows: A Critical Survey of Current Numerical Prediction Capabilities - 262

Shock-Wave Turbulent Boundary Layer Interaction in a Highly Loaded Transonic Fan Blade Cascade - 108

Subsonic Wind Tunnel with Flow Speed Pulsation - 138

Time Resolved Measurements of Turbine Blade Flow Phenomena - 261

SHORT TAKEOFF AIRCRAFT

The control system design methodology of the STOL and maneuver technology demonstrator - 122

SHOT PEENING

An Investigation on Surface Treatments for Improving the Fatigue Resistance of Titanium Alloys - 165

Repair/Refurbishment of Military Aircraft - 87

SHUTTLE IMAGING RADAR

Characterization of Natural Targets Using Multiparametric SIR-C/X-SAR Imagery - 284

SICKNESSES

Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications: General Concepts and Objectives - 37

SIDE-LOOKING RADAR

SAR Systems and Related Signal Processing - 282

Spaceborne SAR simulation using airborne data - 199

SIGNAL ANALYSIS

An Improved Model of Ionospheric Absorption at HF High Latitude Paths - 209

Ultra-Wide-Band Techniques and their Practical Uses - 232

SIGNAL ANALYZERS

A Modular Scalable Signal Processor Architecture for Radar and EW Applications - 100

Adaptive Active Noise Reduction Headset for Helicopter Aircrew - 338

SIGNAL DETECTION

Integrated Air Deployed Strike Surveillance (IADSS) - 287

SIGNAL DETECTORS

NATO Naval Exercises as Observed from Civilian Radar Satellites - 287

SIGNAL DISTORTION

Analysis of Propagation Effects and Non-Linear Distortions on Digital Modulation Schemes - 214

SIGNAL ENCODING

Navigation Accuracy for Absolute Positioning - 44

SIGNAL FADING RATE

Earth-Space Links and Fade-Duration Statistics - 211

SIGNAL GENERATORS

An Approach to Physical Level Chaff Simulation - 231

SIGNAL PROCESSING

Attenuation of Effects and Multiple Trajectories and Interference in Military Radio Communication by Signal Processing - 213

Closed Form Expressions of Algorithmic Performance and Complexity in Signal Processing - 346

Collation of Data and Extremely Low-Power Finder for Telecommunications - 235

CRESUS: Radar Payload for Surveillance UAVs - 236

Discrete Hilbert Transform - 213

Electronic Countermeasures against Synthetic Aperture Radars - 219

Evaluation of a Three-Dimensional Auditory Display in Simulated Flight - 225

Future Trends in Image Processing and Pattern Recognition - 233

Modelling and Simulation of Communication Systems - 233

Neural Network Techniques for Missile Guidance and Control - 353

Optical Processing and Computing - 343

Optics and nonlinear optics for signal processing and computing applications - 374

Precision Imaging Strike Technology Integration Laboratory (PISTIL) - 362

Problem of Modeling Related to Time Limitation of the Pulse Emitted by the POSEIDON Radar-Altitude - 284

SAR Systems and Related Signal Processing - 282

Sensor Synergetics: The Design Philosophy of the Sensor Fusion Demonstrator and Testbed (SFD) at TNO-FEL - 385

Testing HF-Modems: DSP's Open New Possibilities and Make New Demands on Real-Time HF-Simulators - 215

The NATO Data Fusion Demonstrator Project - 386

Trends and Tendencies in LPI Radar - 207

Ultra-Wide-Band Techniques and their Practical Uses - 232

SIGNAL RECEPTION

An Improved Model of Ionospheric Absorption at HF High Latitude Paths - 209

SIGNAL TO NOISE RATIOS

Comparison of RLS Adaptive Array Algorithms in a Strong Multipath Propagation Environment - 215

GPS/INS Integration - 45

IR-Signatures of Ships: A Classification Feature Within a Sensor Network - 288

Surface Forces Measurements with High Spatial and Temporal Resolution by Means of Liquid Crystal Foils, Piezofolios and Surface Hot-Film Arrays - 258

SIGNAL TRANSMISSION

Observations of Doppler Spreading and FSK Signalling Errors on HF Signals Propagating Over High Latitude Paths - 211

SIGNATURE ANALYSIS

High Resolution Bench (HRB) for the Analysis of Ship Signatures - 231

Radar Signature Analysis and Imaging of Military Targets - 229

The Modular Algorithm Concept Evaluation Tool (MACET) Workstation - 223

SIKORSKY AIRCRAFT

Penguin MK2 MOD7 Integration in the Sikorsky S-70B Helicopter Integration and Live Fire Testing - 77

SILICON

Dual-use micromechanical inertial sensors - 264

SILICON CARBIDES

Lightweight Materials for Engines and Structures - 160

SILICON NITRIDES

Machining and Slip-Rolling of Ceramics - 270

Tribological Behaviour of Silicon Nitride-Based Ceramics - 166

SIMULATION

Aerothermodynamics and Propulsion Integration: Synthesis of the AGARD-FDP-VKI Special Course, April 15-19, 1996 - 21

Attentional Control and Situational Awareness in a Complex Air Combat Simulation - 320

Balancing Modeling and Simulation With Flight Test in Military Aircraft Development - 92

Communications Realism with Integrated Terrain-Environment-Multipath Model - 217

Computational Simulation of Hypersonic External Flow: Status of CFD in Europe - 21

High-Power Microwaves Effects on Smart Electronic Weapon Systems - 232

Ice Accretion Simulation - 36

Military Applications of Site-Specific Radio Propagation Modeling and Simulation - 210

Piloted Multiple-Target Simulator for Development of Air-to-Air Fire Control - 132

Sleepiness During an Accurate Night Shift: Neurophysiological Correlates and Effects on Performance - 323

Spaceborne SAR simulation using airborne data - 199

Synthetic Environments - A Tool In Combat Aircraft Design - 90

The Synthetic Environment: The Ultimate Defence Simulation? - 133

The Use of Simulation to Develop an Improved Understanding of Helicopter Tail Rotor Failures and Develop Aircrew Emergency Advice - 79

Use of Multitask Simulation as a Tool for Measuring and Training Situation Awareness - 321

SIMULATORS

Adaptive strike planning with search path allocation - 361

Optimal Resolution of En Route Conflicts - 51

SOSIE: A pragmatic approach to the simulation of Broad Air Defense applied to the theater level - 187

Tactical Environment Servers - 345

Testing HF-Modems: DSP's Open New Possibilities and Make New Demands on Real-Time HF-Simulators - 215

Use of simulation tools and facilities for Rendez-Vous and Docking missions - 151

SISO (CONTROL SYSTEMS)

A maximum likelihood parameter estimation technique to analyse multiple input/multiple output flutter test data - 65

SITTING POSITION

Increase of High-sustained +G(z) tolerance at the expense of pilot's working posture change - 295

SIZE DISTRIBUTION

Aerosol profiles near the sea surface during MAPTIP - 292

Characterisation of atmospheric properties during MAPTIP - 291

SKIN (ANATOMY)

Characterization of the heat flux and estimate of the risks of burns around the engines at very short time of combustion - 160

Hydrobionics Principles of Drag Reduction - 251

SKIN (STRUCTURAL MEMBER)

Damage tolerance evaluation on the A7-P aircraft considering the PoAF usage - 63

Damage tolerance to WFD (Widespread Fatigue Damage) on combat aircraft: An application to a metallic wing lower panel - 63

On aircraft repair verification of a fighter A/C integrally stiffened fuselage skin - 55

Widespread Fatigue Damage In combat aircraft - 63

SKIN FRICTION

Advanced Aerodynamic Measurement Technology - 7

Application of Oil Film Interferometry Skin-Friction to Large Wind Tunnels - 258

Skin Friction Measurement and Transition Detection Techniques for the Ludwig-Tubes at DLR - 258

SKULL

Basilar Skull Fracture Resulting From Compression Neck Loading - 303

SKY WAVES

Link Level Protocols for Radio Channels - 214

SLAMMING

Water Entry of Ship Sections and Axisymmetric Bodies - 254

SLEEP

Early Starts: Effects on Sleep, Alertness and Vigilance - 308

Fatigue and Performance in the Air Traffic Control Environment - 324

Melatonin and its Role in Circadian Rhythm Disruption - 331

Sleepiness During an Accurate Night Shift: Neurophysiological Correlates and Effects on Performance - 323

Zolpidem, Sleepiness and the Psychomotor Capacities of Ground Personnel and Pilots - 310

SLEEP DEPRIVATION

Cognitive Performance During a 64-Hours Sleep Deprivation: Interest of a Slow Release Caffeine - 310

Current Neurological Performance Issues in Army Rotary-Wing Operations - 324

Evaluating Crew Performance After Anti-Emetics: A Screen for Assessing Militarily Relevant Medications - 331

Evasive Maneuvers and High-G Flight Safety After Sleep Deprivation - 308

Modafinil Effects on Spatial Cognition During 60 Hours of Sleep Deprivation - 309

Pharmacological Sleep Management: Interest of Modafinil - 309

Pros and Cons of Strategic Napping on Long Haul Flights - 308

Simulated Sustained Flight Operations and Effects on Vigilance and Performance - 324

Sustaining Helicopter Pilot Alertness With Dexedrine (R) During Sustained Operations - 300

The Efficacy of Dextroamphetamine for Sustaining Helicopter Pilot Performance: An In-Flight Evaluation - 309

Zolpidem, Sleepiness and the Psychomotor Capacities of Ground Personnel and Pilots - 310

SLENDER BODIES

Stability of Supercavitating Slender Body During Water Entry and Underwater Motion - 254

SLIPSTREAMS

Experimental Analysis of the Vortex Wake Structure behind a Propeller-Wing Configuration - 15

SLOTTED WIND TUNNELS

Progress in Determining Wall-Induced Interference in Slotted-Liner Wind Tunnels Using Measured Wall Conditions - 141

SLUSH HYDROGEN

Scramjet Performance Analysis as a Function of Combustion Process Parameters - 114

SMALL SCIENTIFIC SATELLITES

Technology demonstration experiments on STRV-1 - 147

SMART MATERIALS

Smart Structures and Materials in Aerospace Applications of Next Generation - 96

SMART STRUCTURES

A Novel Approach to Structural Design Using Biological Models - 278

Adaptive Aircraft Wing - 74

Characteristics and Processing of Smart Materials - 158

Electromagnetic Antenna and Smart Structures - 218

Future generation materials - 156

General Introduction - 157

Intelligent Processing of Smart Materials - 190

Prospects of Structural Health Monitoring Systems - 87

Shape Memory Alloys and Their Application - 165

Smart Aircraft Structures - 91

Smart Structures and Materials in Aerospace Applications of Next Generation - 96

Smart Structures and Materials: Implications for Military Aircraft of New Generation - 155

Smart Structures, MEMS and Smart Electronics for Aircraft - 238

Structural aspects of active control technology - 123

Use of Neural Networks/Genetic Algorithms for Fault Detection and Sensor Location - 353

SODIUM

Application of Laser-Induced Fluorescence (LIF) to Liquid-Propellant Rocket Engine Testing - 154

SODIUM CHLORIDES

Use of Point Of Care (POC) Laboratory Devices by Critical Care Air Transport Teams (CCATT) of the United States Air Force - 312

SOFTWARE DEVELOPMENT TOOLS

Balancing Modeling and Simulation With Flight Test in Military Aircraft Development - 92

Future Aerospace Technology in the Service of the Alliance - 5

Integrated Flight and Propulsion Control Simulation Tools for Advanced Aircraft and Propulsion Systems - 117

Parallel Computing in Computational Fluid Dynamics - 242

SOFTWARE ENGINEERING

A Survey of Advanced Information Processing (AIP) Technology Areas for Crew Assistant System Development - 346

Advances in Soft-Computing Technologies and Application in Mission Systems - 346

Advances in Supporting Technologies - 355

Architecture and implementation of a multi-sensor data fusion demonstration model within the real-time combat system of the Canadian Patrol Frigate - 352

Capricornio Launcher: An Approach to a Modular and Low Cost Software Architectural Design - 147

Cost Control in the Development of Systems and Their Software - 381

Layered Fault Tolerant Architecture to Support Context-Sensitive Reasoning for Lethal Unmanned Aerial Vehicle Application - 350

The Future of Avionics Architectures - 99

Virtual Product Definition: The Key to Affordable and Supportable Products - 347

SOILS

Biodegradation of energetic compounds: Application to site restoration - 177

SOL-GEL PROCESSES

Advanced Surface Preparation for Metal Alloys - 168

SOLAR ACTIVITY EFFECTS

Turbulence in the Upper Atmosphere: Effects on Systems - 207

SOLAR FLUX

Propagation Diversity Constraints on Reception of GPS Signals at High and Equatorial Latitudes - 236

SOLID LUBRICANTS

Advanced Hard Coatings and Wear Resistant Materials for Aerospace - 167

Advanced Solid Lubricant Coatings for Aerospace Systems - 166

An Investigation on Surface Treatments for Improving the Fretting Fatigue Resistance of Titanium Alloys - 165

High Temperature Tribology for Future Diesel Engines - 271

Improving Solid Lubricated Aerospace Bearings - 270

Sputter-Deposited Lubricant Thin Films Operating at Elevated Temperatures in Air - 167

SOLID PROPELLANT COMBUSTION

Development of insensitive rocket propellants based on ammonium nitrate and polyimino - 174

Development of less polluting propellants - 173

Emission spectroscopy and pyrometry of propellant flames and solid rocket exhaust products - 153

Environmental Aspects of Rocket and Gun Propulsion - 172

SOLID PROPELLANT ROCKET ENGINES

Application of Several Global Methods for Non Destructive Evaluation of Small Solid Propellant Motors - 180

Critical fluid demilitarization and ingredient reclamation technology - 176

Destruction of solid propellant rocket motors with recuperation of energetic materials - 176

Development of insensitive rocket propellants based on ammonium nitrate and polyimino - 174

Estimation of the Life of Solid Propellant Propulsion Systems: Perspectives Offered for the Use of High Density Tomography - 181

Evaluation of environmentally acceptable cleaners as replacements for methyl ethyl ketone and 1,1,1 trichloroethane in solid rocket motor production and maintenance applications - 178

Evaluation of the environmental impact of the static tests of engines with solid propellant - 289

Finding an environmentally acceptable replacement for freon 114B2 (Halon 2402) that meets minuteman LITVC performance criteria - 178

Gas pollutants from ammonium nitrate based propellants - 175

Hydrazinium nitroformate and its use as oxidizer in high performance solid propellants - 174

Methodology and Techniques for Determining Service Life of Solid Rocket Motors - 184

Prediction of the Shelf Life of Munitions: Ballistic and Chemical Properties - 185

Probabilistic Service Life Prediction for Solid Propellant Motors Subjected to Environmental Thermal Loads - 184

Reduced hazard chemicals for solid rocket motor production - 177

Service Life of Solid Propellant Systems - 178

Service Life Prediction Methodologies Aspects of the TTCPTA-14 UK Programme - 182

Service Life Prediction of Solid Rocket Propellant Motors Stored in a Random Thermal Environment - 185

Solid Rocket Motor Service Life Prediction Using Nonlinear Viscoelastic Analysis and a Probabilistic Approach - 184

Solid Rocket Propellant Behavior During Static Firing Test Using Real Time X-Ray Radioscopy - 186

Structural Service Lifetime Modelling for Solid Propellant Rocket Motors - 184

Thermographic Detection of Bond Defects within Models of Solid Propellant Motors - 180

SOLID PROPELLANTS

Characteristics and Determination of the Aging of Solid Propellants - 179

Critical fluid demilitarization and ingredient reclamation technology - 176

Development of environmentally acceptable propellants - 173

Emission spectroscopy and pyrometry of propellant flames and solid rocket exhaust products - 153

Environmental Aspects of Rocket and Gun Propulsion - 172

Evaluation of the environmental impact of the static tests of engines with solid propellant - 289

Hydrazinium nitroformate and its use as oxidizer in high performance solid propellants - 174

Improvements in Rocket Motor Service Life Prediction - 183

Intrinsic Strength of Solid Propellant Bond Systems: Stress-Strain Behavior Bit-in-Tension with Rubber Materials - 184

Methods and Kinetic Models for the Lifetime Assessment of Solid Propellants - 179

Microstructural Damage and Crack Growth Behavior in a Composite Solid Propellant - 179

Miniature Sensor for Measuring Solid Grain Rocket Motor Case Bond Stress - 183

Non-Intrusive Measurement of an Energetic Material Regression Rate - 375

Possible ways of development of ecologically safe solid rocket propellants - 174

Reclaimed and virgin ammonium perchlorate variations and how they affect solid propellant properties - 176

Service Life of Solid Propellant Systems - 178

Solid propellants for space launch vehicles not generating or little hydrochloric gas - 173

Structural Assessment of Solid Propellant Grains - 154

Verification of the Swanson Nonlinear Thermo-Viscoelastic Model Using Stress Gage Technology - 183

SOLID ROCKET PROPELLANTS

A complete resource recovery system for solid rocket propellants - 176

Clean propellants for space launch boosters - 173

Destruction of solid propellant rocket motors with recuperation of energetic materials - 176

Development of less polluting propellants - 173

Environmental Aspects of Rocket and Gun Propulsion - 172

Environmental impacts from launching chemical rockets - 289

Evaluation of ammonium nitrate propellant emissions - 175

Methods and Kinetic Models for the Lifetime Assessment of Solid Propellants - 179

Possible ways of development of ecologically safe solid rocket propellants - 174

Solid Rocket Propellant Behavior During Static Firing Test Using Real Time X-Ray Radioscopy - 186

Test rig for solid propellant rocket motors that reduces the impact of noise on the environment - 289

The Role of NDE in Service Life Prediction of Solid Rocket Propellant - 181

Use of new oxidizers and binders to meet clean air requirements - 175

SOLID STATE

Solid-state data recorder, next development and use - 264

The Solid State Adaptive Rotor: Design, Development and Implications for Future Rotorcraft - 83

SOLID STATE LASERS

Development and flight testing of an Obstacle Avoidance System for US Army helicopters - 29

The High Altitude Balloon Experiment demonstration of acquisition, tracking, and pointing technologies (HABE-ATP) - 187

SOLIDIFIED GASES

Stripping with dry ice - 189

SOLUTIONS

Digital Communications Systems: Propagation Effects, Technical Solutions, Systems Design - 208

Tip Vortex Roll-up and Cavitation in Water and Polymer Solutions - 255

SOLVENTS

Evaluation of environmentally acceptable cleaners as replacements for methyl ethyl ketone and 1,1,1 trichloroethane in solid rocket motor production and maintenance applications - 178

LOVA Propellant Aging: Effect of Residual Solvent - 182

Overview of Cleaning/Surface Preparation for Metals in the US - 290

SONIC NOZZLES

Sonic Nozzles for Mass Flow Measurement and Reference Nozzles for Thrust Verification - 249

SOOT

Development and Application of Laser Induced Incandescence (LII) as a Diagnostic for Soot Particulate Measurements - 268

SOUND FIELDS

High Speed Body Motion and Sound Generation - 372

SOUND GENERATORS

Evaluation of a Three-Dimensional Auditory Display in Simulated Flight - 225

High Speed Body Motion and Sound Generation - 372

SOUND INTENSITY

Active Hearing Protectors: New Developments and Measurement Procedures - 336

SOUND LOCALIZATION

Design Considerations for 3-D Auditory Displays in Cockpits - 224

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Extending the Frequency Range of Existing Auditory Warnings - 30

The Abilities of Listeners to Localise Defence Research Agency Auditory Warnings - 330

SOUND PRESSURE

A boundary integral method for unified transonic aerodynamic and aeroacoustic analysis of hovering rotors - 10

External noise of single rotor helicopters - 370

Next Generation Active Noise Reduction Systems - 338

Wind tunnel flutter testing on shingles in the transonic and supersonic speed regime - 11

SOUND TRANSMISSION

Audio Display Technology - 372

Flight Demonstration of an Integrated 3-D Auditory Display for Communications, Threat Warning, and Targeting - 225

SOUND WAVES

Forecast of the impulse noise of the engines at very short time of combustion - 176

SPACE BASED RADAR

Development of a modal testing support system for space-based radar satellite structures - 146

Guidance and Control for Future Air-Defence Systems - 186

Imaging Tools for Spaceborne SAR Programme - 282

SPACE CAPSULES

Blunt Bodies Dynamic Derivatives - 20

Capsule Aerothermodynamics - 19

Capsule Aerothermodynamics: Missions, Critical Issues Overview and Course Roadmap - 19

Communication Blackout During Earth-Atmosphere Entry of Capsules - 224

Rarefied Flows of Planetary Entry Capsules - 19

Real Gas: CFD Prediction Methodology Flow Physics for Entry Capsule Mission Scenarios - 19

SPACE COMMERCIALIZATION

Strawman Concept and Panel Discussion - 228

SPACE COMMUNICATION

Strawman Concept and Panel Discussion - 228

SPACE EXPLORATION

Real Gas: CFD Prediction Methodology Flow Physics for Entry Capsule Mission Scenarios - 19

SPACE FLIGHT

Space systems design and development testing - 149

Strawman Concept and Panel Discussion - 228

SPACE MISSIONS

GPS-based navigation for space applications - 148

Knowledge-based systems applications for automating spacecraft operations: Users feedback and lessons learned - 148

Spaceborne Optical Remote Sensing - 281

SPACE NAVIGATION

Aerospace navigation systems - 39

Aerospace navigation systems requirements for fixed wing aircraft - 97

GPS-based navigation for space applications - 148

Satellite navigation - 148

Spacecraft navigation requirements - 148

Test methodology - 41

SPACE PROBES

Blunt Bodies Dynamic Derivatives - 20

Capsule Aerothermodynamics - 19

SPACE PROGRAMS

Aeroassist Key to Returning From Space and the Case for AFE - 153

Tailoring test requirements for application in multinational programmes - 387

SPACE RENDEZVOUS

Use of simulation tools and facilities for Rendezvous and Docking missions - 151

SPACE SHUTTLE ORBITERS

NASA and ESA Ground Facility Simulations of Shuttle Orbiter Aerothermodynamics - 144

Shuttle orbiter experiments: Use of an operational vehicle for advancement and validation of space systems design technologies - 152

SPACE SIMULATORS

Extension of the ESA test centre with HYDRA: A new tool for mechanical testing - 152

SPACE STATION FREEDOM

Structural verification of the Space Station Freedom Force Moment Sensor (FMS) using finite element modelling techniques and qualification testing - 149

SPACE SURVEILLANCE (SPACEBORNE)

Airborne and Spaceborne SAR Systems: Possibilities and Limitations for Military Use - 232

SPACE TRANSPORTATION SYSTEM

Aerothermodynamic testing requirements for future space transportation systems - 150

Future Space Transportation Systems and their Potential Contribution to the NATO Mission - 147

Separation of lifting vehicles at hypersonic speed wind tunnel tests and flight dynamics simulation - 11

SPACE-TIME FUNCTIONS

Global Air Traffic Management (GATM) - 51

SPACEBORNE EXPERIMENTS

NASA technology flight experiments program - 151

Technology demonstration experiments on STRV-1 - 147

US in-space electric propulsion experiments - 151

SPACECRAFT

Space systems design and development testing - 149

SPACECRAFT CHARGING

Technology demonstration experiments on STRV-1 - 147

SPACECRAFT CONSTRUCTION MATERIALS

Advanced Polymeric & Metallic Composite Materials for Space and Aerospace Vehicle Structures and Strength Optimization of Composite Structures and their Certification - 155

SPACECRAFT CONTROL

Knowledge-based systems applications for automating spacecraft operations: Users feedback and lessons learned - 148

SPACECRAFT DEFENSE

Tactical Reconnaissance by a Constellation of Small Satellites - 287

SPACECRAFT DESIGN

Aeroassist Key to Returning From Space and the Case for AFE - 153

Aerothermodynamic testing requirements for future space transportation systems - 150

Capsule Aerothermodynamics: Missions, Critical Issues Overview and Course Roadmap - 19

Entry and Vehicle Design Considerations - 152

Hypersonic aerodynamic/aerothermal test facilities available in Europe to support space vehicle design - 146

NASA technology flight experiments program - 151

Possibilities and Limitations of Spaceborne SAR with Respect to Military Reconnaissance - 227

Real Gas: CFD Prediction Methodology Flow Physics for Entry Capsule Mission Scenarios - 19

Space systems design and development testing - 149

SPACECRAFT DOCKING

Use of simulation tools and facilities for Rendezvous and Docking missions - 151

SPACECRAFT GUIDANCE

Knowledge-based systems applications for automating spacecraft operations: Users feedback and lessons learned - 148

SPACECRAFT INSTRUMENTS

Development of a modal testing support system for space-based radar satellite structures - 146

SPACECRAFT LAUNCHING

An overview of DOD test requirements for launch and space systems - 149

Clean propellants for space launch boosters - 173

Environmental impacts from launching chemical rockets - 289

Overview of Propulsion Performance - 119

Pegasus air-launched space booster flight test program - 150

Solid propellants for space launch vehicles not generating or little hydrochloric gas - 173

The impact of space rocket launches on the earth ozone layer - 289

SPACECRAFT LUBRICATION

Tribological Problems In Spacecrafts - 270

SPACECRAFT ORBITS

Spacecraft Attitude and Orbit Control Systems testing - 151

SPACECRAFT POWER SUPPLIES

Laser Power Beaming: An Emerging New Technology for Power and Propulsion in Space - 269

Tests of engines have stationary plasma in simulated space environment - 153

SPACECRAFT PROPULSION

Laser Power Beaming: An Emerging New Technology for Power and Propulsion in Space - 269

SPACECRAFT REENTRY

Planetary Atmospheres, Basic Thermodynamics and Regimes - 387

Shuttle orbiter experiments: Use of an operational vehicle for advancement and validation of space systems design technologies - 152

SPACECRAFT SHIELDING

Ablation - 250

Ablation and Temperature Sensors for Flight Measurements in Reentry Body Heat Shields - 153

SPACECRAFT STRUCTURES

Spacecraft deployable structure testing - 149

SPACECRAFT TRAJECTORIES

Spacecraft navigation requirements - 148

The impact of space rocket launches on the earth ozone layer - 289

SPAIN

Experience in helicopter aeroevacuation in the community of Madrid, Spain - 357

SPATIAL DISTRIBUTION

Effects of spatial and temporal variability of atmospheric refractivity on the accuracy of propagation assessments - 202

Refractive variability during VOCAR 23 August to 3 September 1993 - 202

Tropospheric refractivity profiles inferred from low elevation angle measurements of Global Positioning System (GPS) signals - 291

SPATIAL RESOLUTION

Eco-Climatic Classifications by Use of NOAA-AVHRR Data: A Case Study: Tuscany (Central Italy) - 290

SPECIFIC IMPULSE

Methods and Kinetic Models for the Lifetime Assessment of Solid Propellants - 179

SPECIFICATIONS

Aging Combat Aircraft Fleets: Long Term Applications - 86

An overview of DOD test requirements for launch and space systems - 149

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

- Numerical Simulations of Stator-Rotor Interactions of Compressor Blade Rows - 110
- On the Computation of Unsteady Turbomachinery Flows - 110
- Wake Passing in LP Turbine Blades - 109

STEADY FLOW

- A Comparison of Pressure Measurements Between a Full-Scale and a 1/16-Scale F/A-18 Twin Tail During Buffet - 127

Adaption by Grid Motion for Unsteady Euler Aerofoil Flows - 247

Models for Calculating the Three Dimensional Fluctuations in the Framework of Central Flow of a Turbine Engine - 241

PSP: Intensity and Lifetime Measurements for Steady and Nonsteady Flow - 260

STEELS

Corrosion of landing gear steels - 163

STIFFNESS

Three-Dimensional Progressive Failure Analysis of Pin/Bolt Loaded Composite Laminates - 279

STIFFNESS MATRIX

A PCG/E-B-E Iteration for High Order and Fast Solution of 3-D Navier-Stokes Equations - 245

STIMULANTS

Sustaining Helicopter Pilot Alertness With Dextro-drine (R) During Sustained Operations - 300

STIMULATION

Effects of Stress on the Immunocellular System in Military Pilots - 299

STOCHASTIC PROCESSES

Global Air Traffic Management (GATM) - 51

STORABLE PROPELLANTS

Propellant handling provisions at a test facility for hypergolic bipropellant rocket engines - 178

STORAGE STABILITY

- Characterization of the Degradation of the Polymer Binder in GAP-Based Propellants - 180
- Estimation of the Life of Solid Propellant Propulsion Systems: Perspectives Offered for the Use of High Density Tomography - 181
- Miniature Sensor for Measuring Solid Grain Rocket Motor Case Bond Stress - 183
- Prediction of the Shelf Life of Munitions: Ballistic and Chemical Properties - 185
- Service Life of Solid Propellant Systems - 178

STORAGE TANKS

Cryogenic Engineering and Materials - 190

STOVL AIRCRAFT

- Future Technology Requirements for UK Combat Engines - 112
- Powerplants and Lift Systems for ASTROVL Aircraft: The Challenges to an Engine Maker - 113

STRAIN ENERGY METHODS

Evaluation of patch effectiveness in repairing aircraft components - 55

STRAIN GAGE BALANCES

- Cryogenic Internal Balance Calibration at ETW - 137
- Experimental Techniques for Modelling Store Carriage and Release at Small Scales - 70
- Force Testing with Internal Strain Gage Balances - 135
- Summary Report of the First International Symposium on Strain Gauge Balances and Workshop on AoA/Model Deformation Measurement Techniques - 266
- The Status of Internal Strain Gage Balance Development for Conventional and for Cryogenic Wind Tunnels - 266

STRAIN GAGES

- High Temperature - Thin Film Strain Gages Based on Alloys of Indium Tin Oxide - 267
- In flight research with instrumented main and tail rotor blades using the DRA Bedford aeromechanics research Lynx helicopter - 60
- Overcoats for the Improved Performance of PdCr High Temperature Thin Film Strain Gages - 267

STRAIN MEASUREMENT

High Temperature - Thin Film Strain Gages Based on Alloys of Indium Tin Oxide - 267

STRAIN RATE

- Cervical Spinal Cord Injury Tolerance under +Gz Acceleration - 297
- Exfoliation corrosion and stress corrosion cracking behaviour of Al-Li alloys - 163

STRAPDOWN INERTIAL GUIDANCE

Design considerations for a suboptimal Kalman filter - 237

STRATOCUMULUS CLOUDS

Synoptic Variability Revealed by Satellite and Equivalent Altitude - 286

STRATOSPHERE

The impact of space rocket launches on the earth ozone layer - 289

STRESS (PHYSIOLOGY)

Medical Screening of Subjects for Acceleration and Positive Pressure Breathing - 301

STRESS (PSYCHOLOGY)

- A Conceptual Approach to the Study of Stress in Peacekeeping Personnel - 316
- Selection of Future Fighter Pilots - 327
- Stress Factors in the SPAF Personnel Assigned to Humanitarian and Peace Keeping Operations - 316

STRESS ANALYSIS

An Analysis of Stress and Coping Factors on Air Crew During Emergency Medical Service (EMS) Helicopter Operations - 322

Bolted Joints in Composite Structures: An Overview - 158

Coupling analysis by a rapid near field measurement technique - 196

Damage occurrence on composites during testing and fleet service: Repair of Airbus aircraft - 57

Design and structural validation of CF116 upper wing skin boron doubler - 54

Development of a Stressing Method for Bolted Joints - 279

Evaluation of patch effectiveness in repairing aircraft components - 55

Flowfield Prediction of Three-Dimensional Wing Trailing Vortices using Advanced Turbulence Models - 13

Improvements in Rocket Motor Service Life Prediction - 183

Instrumented Service Life Program for the Pictor Rocket Motor - 183

Repair technology for thermoplastic aircraft structures - 56

Scarf repairs to graphite/epoxy components - 57

Stress Analysis of Open and Fastener Hole Composites Based on Three-Dimensional Spline Variational Technique - 279

Stress and Failure Analysis of Bonded Composite-to-Metal Joints - 279

Thermal Mechanical Fatigue of Model Blades Made From CC and DS Superalloys - 278

Three-Dimensional Progressive Failure Analysis of Pin/Bolt Loaded Composite Laminates - 279

TMF Life Prediction Approach for Turbine Blades - 277

STRESS CONCENTRATION

Analysis Method for Bolted Composite Joints Subjected to In-Plane Shear Loads - 279

STRESS CORROSION CRACKING

- Corrosion of landing gear steels - 163
- Exfoliation corrosion and stress corrosion cracking behaviour of Al-Li alloys - 163
- Risk analysis in the presence of corrosion damage - 62
- Specific features of corrosion behavior of stainless maraging steels for aerospace application - 163

The corrosion and protection of advanced aluminium-lithium airframe alloys - 162

STRESS CYCLES

Thermomechanical Fatigue in Gas Turbine Engines: The Reasons of a Concern - 103

The page numbers in this Index generally indicate the page on which the index term occurs; the beginning of the abstract may be on the previous page.

STRESS DISTRIBUTION

A special uniaxial coupon test specimen for the simulation of multiple site fatigue crack growth and link-up in fuselage skin splices - 61

Miniature Sensor for Measuring Solid Grain Rocket Motor Case Bond Stress - 183

Visualization and Measurement of Surface Shear Stress Vector Distributions Using Liquid Crystal Coatings - 258

Widespread Fatigue Damage in combat aircraft - 63

STRESS INTENSITY FACTORS

A concept for the evaluation of MSD based on probabilistic assumptions - 275

Probabilistic Evaluation of Bolted Joints in Polymer Matrix Composites - 167

The effect of proof pressure testing on the retardation of multi-site damage - 63

STRESS MEASUREMENT

Development of a Stressing Method for Bolted Joints - 279

Meeting the Advanced Instrumentation the Needs of the Integrated High Performance Turbine Engine Technology and High Cycle Fatigue Programs - 266

Miniature Sensor for Measuring Solid Grain Rocket Motor Case Bond Stress - 183

Turbomachinery Blade Tip Measurement Techniques - 273

Visualization and Measurement of Surface Shear Stress Vector Distributions Using Liquid Crystal Coatings - 258

Wall-Shear Stress Measurement with Quantitative IR-Thermography - 258

STRESS RATIO

Elevated Temperature Fatigue of IN718: Effects of Stress Ratio and Frequency - 276

STRESS-STRAIN RELATIONSHIPS

Damage Mechanisms for Thermomechanical Fatigue of Aircraft Engines Materials - 104

Hygrothermal Fatigue of Composite Bonded Joints - 159

Intrinsic Strength of Solid Propellant Bond Systems: Stress-Strain Behavior Bit-In-Tension with Rubber Materials - 184

Modelling of Thermomechanical Fatigue in Aero Engine Turbine Blades - 104

Service Life Prediction of Solid Rocket Propellant Motors Stored in a Random Thermal Environment - 185

Standardization Activities in TMF Test Methodologies - 276

Stress in Peace Support Operations: Recent Canadian Experiences - 316

Thermal Fatigue: A Useful Tool to Assess Low Cycle Fatigue Damage in Superalloys for Components Experiencing Thermal Transients - 276

Thermal Mechanical Fatigue of Model Blades Made From CC and DS Superalloys - 278

Verification of the Swanson Nonlinear Thermo-Viscoelastic Model Using Stress Gage Technology - 183

STRIPPING

Background to plastic media blasting - 188

Bioremediation of wheat starch media waste - 288

Operational parameters and material effects - 189

Paint removal principles - 188

Process evaluation - 190

STRUCTURAL ANALYSIS

Analysis of aircraft panels with WFD, based on the Elastic Plastic Finite Element Alternating Method (EPFEAM) and T - 62

Automated Structural Analysis Process at Rockwell - 75

Bonded composite repair of metallic aircraft components: Overview of Australian activities - 53

Design and structural validation of CF116 upper wing skin boron doubler - 54

Global/Local Analysis in Finite Element Technology - 355

Integrated Airframe Design Technology - 74

Loads and Requirements for Military Aircraft - 4

Multiple site fatigue damages of aircraft structures - 62

Probabilistic Approaches: Composite Design - 84

Qualification by Analysis - A Framework for the Future - 377

Risk analysis in the presence of corrosion damage - 62

Risk assessment of an aging military trainer aircraft - 62

Solid Rocket Motor Service Life Prediction Using Nonlinear Viscoelastic Analysis and a Probabilistic Approach - 184

Spacecraft deployable structure testing - 149

Statistical property of widespread fatigue damage - 274

Structural Assessment of Solid Propellant Grains - 154

Structural verification of the Space Station Freedom Force Moment Sensor (FMS) using finite element modelling techniques and qualification testing - 149

Structural/Ballistic Instability Ageout Mechanism in the Sparrow Mark 52 SRM - 153

Topology Optimisation of 3D Linear Elastic Structures - 278

Virtual Manufacturing for Composites - 349

Widespread Fatigue Damage in Military Aircraft - 61

STRUCTURAL DESIGN

3-D Composites in Primary Aircraft Structure Joints - 159

Advanced Polymeric & Metallic Composite Materials for Space and Aerospace Vehicle Structures and Strength Optimization of Composite Structures and their Certification - 155

Aircraft Fire Safety - 31

Attachment of Ceramic Matrix Composites of AFR700B Composites for Exhaust Washed Airframe Structures - 159

Automated Structural Analysis Process at Rockwell - 75

Composite materials in aircraft structures (design, optimization and certification) - 156

Crash Resistant Composite Subfloor Structures for Helicopters - 80

Damage occurrence on composites during testing and fleet service: Repair of Airbus aircraft - 57

Determination and Verification of Operational Maneuver Parameters and Time Histories - 84

Ducted Tail Rotor Designs for Rotorcraft and their Low Noise Features - 81

Dynamic Loading Considerations in Design of Modern Combat Aircraft - 85

Eurofighter 2000 Structural Design Criteria and Design Loading Assumptions - 85

Evolution of F-16 Loads and Requirements - 85

STRUCTURAL MEMBERS

Verification of the Swanson Nonlinear Thermo-Viscoelastic Model Using Stress Gage Technology - 183

STRUCTURAL RELIABILITY

Design of damageable aircraft polymer composite structures with a high strength and enhanced service life - 156

Reliability, maintenance and life cycles of composite structures - 156

STRUCTURAL STABILITY

Airframe Inspection Reliability - 275

Application of linearized Euler Equations to the estimation of flotation - 22

Mastering the effect of microvibrations on the performances of reconnaissance satellites - 150

Spacecraft deployable structure testing - 149

STRUCTURAL VIBRATION

A historical overview of flight flutter testing - 64

A maximum likelihood parameter estimation technique to analyse multiple input/multiple output flutter test data - 65

A Nonlinear Model for Landing Gear Shimmy with Applications to the McDonnell Douglas F/A-18A - 69

A Review of Aircraft Landing Gear Dynamics - 67

Active and Passive Damping Techniques - 278

Advanced aeroservoelastic testing and data analysis - 64

Advances in the analysis of flight flutter test data - 66

Aeroelastic testing of an unmanned air vehicle - 65

Elements of the B-2 flight flutter test program - 66

Flight flutter testing of a turbo-prop aircraft by using external excitation devices - 64

Flight flutter tests of transport civil aircraft with an Electronic Flight Control System - 126

Flutter flight test of the RANGER 2000 aircraft - 64

Fuseage Vibration Control Using Semi-Active Front Gear - 68

Ground structural coupling testing and model updating in the aeroservoelastic qualification of combat aircraft - 67

In-Flight Measurements and Prediction of Internal Noise of ECUREUIL Helicopter - 81

Influence of Nonlinearity on the Shimmy Behaviour of Landing Gear - 68

Landing Gear Shimmy: De Havilland's Experience - 68

Mastering the effect of microvibrations on the performances of reconnaissance satellites - 150

Model and Full Scale Investigations of the Low Frequency Vibration Phenomena of the DNW Open Jet - 142

Optical Blade Vibration Measurement at MTU - 375

Parameter estimation methods for flight flutter testing - 65

Self-Induced Oscillations of Landing Gear as an Integral Landing Gear Aircraft System Problem - 68

Spacecraft deployable structure testing - 149

System of aeroservoelastic experimental and numerical investigations for aircraft design and certification - 66

The Design, Qualification and Maintenance of Vibration-Free Landing Gear - 67

Turbomachinery Blade Tip Measurement Techniques - 273

Unsteady Tire Dynamics and the Application Thereof to Shimmy and Landing Load Computations - 68

US Air Force/DEI flutter exciter test program - 64

Vibrational Analysis of Engine Components Using Neural-Net Processing and Electronic Holography - 355

STRUCTURAL WEIGHT

Prospects of Structural Health Monitoring Systems - 87

STRUCTURED GRIDS (MATHEMATICS)

Multiblock Structured Grid Algorithms for Euler Solvers in a Parallel Computing Framework - 246

Multidimensional Upwind Dissipation for 2D/3D Euler/Navier-Stokes Applications - 244

New directions in rotorcraft computational aerodynamics research in the US - 1

Numerical Simulation of Internal and External Gas Dynamic Flows on Structured and Unstructured Adaptive Grids - 244

Structured grid solvers 1: Accurate and efficient flow solvers for 3D applications on structured meshes - 351

Structured grid solvers 2: Parallelization of block structured flow solvers - 351

STRUTS

Airplane Flow-Field Measurements and the Flying Strut - 24

SUBMERGED BODIES

Cavitation Scale Effects: A Representation of Its Visual Appearance and Empirically Found Relations - 255

SUBMERGING

Evaluation of Aqueous Degreasing as Replacement for Vapour Degreasing with 1,1,1-Trichloroethane at Bombardier-Canadair - 191

SUBROUTINES

A unified unsteady aerodynamic module for aeroelastic and MDO applications - 24

SUBSONIC FLOW

Compressible Turbulent Boundary Layers - 248

Experimental Analysis of the Vortex Wake Structure behind a Propeller-Wing Configuration - 15

Shear Sensitive Liquid Crystals in Subsonic and Transonic Wind Tunnel Testing - 259

Surface Forces Measurements with High Spatial and Temporal Resolution by Means of Liquid Crystal Foils, Piezofolios and Surface Hot-Film Arrays - 258

Turbulent Boundary Layers in Subsonic and Supersonic Flow - 241

Unsteady Subsonic Aerodynamics for Maneuvering Wing/Fuselage/Pylon/Store Configuration and Store Separation Including Wake Effects - 241

SUBSONIC SPEED

Compressibility effects on dynamic stall of oscillating airfoils - 8

High incidence unsteady aerodynamics for aeroservoelastic predictions - 23

Progress in Determining Wall-Induced Interference in Slotted-Liner Wind Tunnels Using Measured Wall Conditions - 141

Unsteady Subsonic Aerodynamics for Maneuvering Wing/Fuselage/Pylon/Store Configuration and Store Separation Including Wake Effects - 241

SUBSONIC WIND TUNNELS

Aerodynamic Design of Axial-Flow Fans for Subsonic Wind Tunnels - 141

Aerodynamic Design of Nozzles for Subsonic and Transonic Wind Tunnels - 143

Airplane Flow-Field Measurements and the Flying Strut - 24

Development of Close-Circuit Subsonic Wind Tunnel with Diametral Fan - 142

Evaluating Analytically and Experimentally the Gas Dynamics of Transonic Wind Tunnels with Devices for Air Evacuation from Plenum Chamber - 141

Experimental Study of a Low-Speed Wind Tunnel Test Section with a Free Jet - 142

New Captive Trajectory System for the Large Subsonic S1MA Wind Tunnel of ONERA - 70

SUBSTITUTES

Teleradiology in the Armed Forces of The Netherlands - 315

SUBSTRATES

Operational parameters and material effects - 189

SUBSTRUCTURES

Visual and Non-Destructive Inspection Technologies - 275

SUCTION

Rotor Blade Pressure Measurement in a Rotating Machinery Using Pressure and Temperature Sensitive Paints - 260

SULFURIC ACID

Phosphoric Sulfuric Acid Anodizing (PSA): A Heavy Metal Free Alternative for High Quality Surface Pretreatment of Aluminium - 191

SUNLIGHT

Radiance of the ocean horizon - 281

SUNSPOT CYCLE

Propagation Diversity Constraints on Reception of GPS Signals at High and Equatorial Latitudes - 236

SUPERCAVITATING FLOW

Computer Simulation of Unsteady Supercavitating Flows - 254

Control of Cavity Parameters at Supercavitating Flow - 255

High Speed Body Motion in Water - 250

Investigation of High-Speed Supercavitating Underwater Motion of Bodies - 253

Some Problems of Supercavitating Flows - 253

Some Problems of the Supercavitation Theory for Sub or Supersonic Motion in Water - 254

Stability of Supercavitating Slender Body During Water Entry and Underwater Motion - 254

Supercavitating Flows at Supersonic Speed in Compressible Water - 253

SUPERHEATING

Micron-sized droplets irradiated with a pulsed carbon dioxide laser: Measurement of explosion and breakdown thresholds - 239

SUPERHIGH FREQUENCIES

Integrated Data Link for UTA Applications: Design Considerations and Development Results - 236

Multiple UMA's In-Flight Management - 364

Remote Sensing of Evaporation Ducts Using SHF Propagation Measurements - 286

SUPERSONIC AIRCRAFT

Advanced Oxygen Systems for Aircraft - 335

SUPERSONIC COMBUSTION RAMJET ENGINES

Aerothermodynamics and Propulsion Integration for Hypersonic Vehicles - 3

Air Intake and Air Intake / Combustion Interaction - 89

Critical Physical Phenomena in Scramjet Propulsion - 118

Hypersonic Air-Breathing Missile Propulsion - 118

Inlet and Propulsion Integration of Scramjet Propelled Vehicles - 118

Missile Aerothermodynamics and Propulsion Integration - 376

Overview of Propulsion Performance - 119

Scramjet and Dual Mode Ramjets - 118

Scramjet Performance Analysis as a Function of Combustion Process Parameters - 114

SUPERSONIC DIFFUSERS

Scramjet Performance Analysis as a Function of Combustion Process Parameters - 114

SUPERSONIC FLOW

Compressible Turbulent Boundary Layers - 248

The International Test and Training "Range" - 370

TEST STANDS

Application of Laser-Induced Fluorescence (LIF) to Liquid-Propellant Rocket Engine Testing - 154

Optical Instrumentation for Temperature and Velocity Measurements in Rig Turbines - 375

Recent Developments in the Application of Laser Doppler Anemometry to Compressor Rigs - 260

Tailoring test requirements for application in multinational programmes - 387

Utilization of 2.5D and 3D Calculations of Unstable Flow for Selecting Instrumentation of a Turbine Test Stand - 130

TEST VEHICLES

Test aspect of single stage to orbit systems - 150

TESTS

An overview of DOD test requirements for launch and space systems - 149

Environment Models and Threat Simulators: High Quality and Lower Cost Validation of EW Systems - 208

Space systems design and development testing - 149

Spacecraft deployable structure testing - 149

TETHERED SATELLITES

Expectations from EMET and OESEE Ground Listening of Possible E.M. Events Generated by the TSS 1R - 286

TETHERING

Expectations from EMET and OESEE Ground Listening of Possible E.M. Events Generated by the TSS 1R - 286

TETRAHEDRONS

Model and Full Scale Investigations of the Low Frequency Vibration Phenomena of the DNW Open Jet - 142

THEMATIC MAPPERS (LANDSAT)

Use of Remote Sensing for Monitoring the Lagoon Kocycagiz and its Environment in Turkey - 286

THERMAL CONDUCTIVITY

Advanced Processing of TBC's for Reduced Thermal Conductivity - 169

Cryogenic Engineering and Materials - 190

Microstructure and Thermal Conductivity of Layered Thermal Barrier Coatings Processed by Plasma Spray and Physical Vapor Deposition Techniques - 171

Modelling the Thermal Conductivity of Thermal Barrier Coatings - 171

Thermal Barrier Coatings: The Thermal Conductivity Challenge - 168

Thermal Sprayed Nanostructured Thermal Barrier Coatings - 170

Z-Fiber Technology and Products for Enhancing Composite Design - 159

THERMAL CONTROL COATINGS

Advanced Processing of TBC's for Reduced Thermal Conductivity - 169

Advantages/Disadvantages of Various TBC Systems as Perceived by the Engine Manufacturer - 172

Bond Coat Considerations for Thermal Barrier Coatings - 172

Effective Spectral Emissivity Measurements of Superalloys and YSZ Thermal Barrier Coating at High Temperature Using a 1.6 Micron Single Wavelength Pyrometer - 172

Electron Beam Physical Vapour Deposition Thermal Barrier Coatings: A Comparative Evaluation of Competing Deposition Technologies - 170

Evaluation of Thermal Barrier Coatings From Burner Rig Tests - 171

Graded Design of EB-PVD Thermal Barrier Coating Systems - 171

In-Flight Particle Diagnostics for On-Line Process Control During Deposition of Plasma-Sprayed TBCs - 169

Microstructure and Thermal Conductivity of Layered Thermal Barrier Coatings Processed by Plasma Spray and Physical Vapor Deposition Techniques - 171

Modelling the Thermal Conductivity of Thermal Barrier Coatings - 171

On Thick Thermal Barriers for Combustor Application - 169

Plasma Assisted CVD of Thick Yttria Partially Stabilized Zirconia Coatings - 170

Processing, Characterisation, and Testing of EB-PVD Thermal Barrier Coatings - 170

Recent Developments in Plasma Sprayed Thermal Barrier Coatings - 169

TBCs on Free-Standing Multilayer Components - 170

The Effect of TBC Utilization in the Design of Robust Aircraft Combustors - 172

Thermal Barrier Coatings - 168

Thermal Barrier Coatings: The Thermal Conductivity Challenge - 168

Thermal Sprayed Nanostructured Thermal Barrier Coatings - 170

THERMAL CYCLING TESTS

Application of Several Global Methods for Non Destructive Evaluation of Small Solid Propellant Motors - 180

Bonded composite repair of thin metallic materials: Variable load amplitude and temperature cycling effects - 54

Composite repair of metallic airframe: Twenty years of experience - 54

Elevated Temperature Component Fatigue Robustness: An Holistic Approach - 277

Ensuring composite structure strength - 157

Instrumented Service Life Program for the Pictor Rocket Motor - 183

TMF Response of Ti-48Al-2V Alloy and Its Composite - 157

THERMAL EMISSION

Radiance of the Wind-Ruffled Sea - 219

THERMAL ENVIRONMENTS

Service Life Prediction of Solid Rocket Propellant Motors Stored in a Random Thermal Environment - 185

THERMAL FATIGUE

A Summary of Damage Mechanisms and Mechanical Property Degradation in Titanium Matrix Composites Subjected to TMF Loadings - 157

Axial-Torsional, Thermomechanical Fatigue Behavior of Haynes 188 Superalloy - 165

Damage Mechanism Assessment on Turbine Blades Superalloys Through TMF Tests - 104

Damage Mechanisms for Thermomechanical Fatigue of Aircraft Engines Materials - 104

Deformation and Failure Mechanisms of DS CM 247 LC Under TMF and LCF Loading - 277

Effects of Cycle Type and Coating on the TMF Lives of CMSX6 - 276

Elevated Temperature Component Fatigue Robustness: An Holistic Approach - 277

Elevated Temperature Fatigue of IN718: Effects of Stress Ratio and Frequency - 276

Fatigue Crack Growth Under TMF - 277

Modelling of Thermomechanical Fatigue in Aero Engine Turbine Blades - 104

Modelling of Thermomechanical Fatigue Including Phase Transformations - 277

Non-isothermal Fatigue: Methods, Results and Interpretation - 276

Standardization Activities in TMF Test Methodologies - 276

The Effect of TBC Utilization in the Design of Robust Aircraft Combustors - 172

Thermal and Mechanical Loading on a Fire Protection Shield due to a Combustor Burn-Through - 34

Thermal Fatigue: A Useful Tool to Assess Low Cycle Fatigue Damage in Superalloys for Components Experiencing Thermal Transients - 276

Thermal Mechanical Fatigue and its Effect on Combustor Design - 104

Thermal Mechanical Fatigue of Aircraft Engine Materials - 103

Thermal Mechanical Fatigue of Model Blades Made From CC and DS Superalloys - 278

Thermo-Mechanical Behavior of IN 738 LC and SC 16 - 277

Thermomechanical Fatigue in Gas Turbine Engines: The Reasons of a Concern - 103

TMF Experience with Gas Turbine Engine Materials - 103

TMF Life Prediction Approach for Turbine Blades - 277

TMF Response of Ti-48Al-2V Alloy and Its Composite - 157

THERMAL MAPPING

Aerosol maps made during MAPIP - 292

Aerosol profiles near the sea surface during MAPIP - 292

Fusion of Visible and Thermal Imagery Improves Situational Awareness - 386

MAPIP: Canada's measurements of refraction effects - 201

Polarization enhancement of contrast in infrared ship/background imaging - 373

Summary of the Marine Aerosol Properties and Thermal Imager Performance trial (MAPIP) organized by NATO AC/243 Panel 4/RSG.8 on Atmospheric Propagation Effects on Electro-Optical Systems, 11 October - 5 November 1993 - 293

The Phoenix Target Acquisition and Surveillance System - 364

Trauma Surgery for Contingency Operations: Test Based Improvements - 313

THERMAL NOISE

Comparison of RLS Adaptive Array Algorithms in a Strong Multipath Propagation Environment - 215

THERMAL PROTECTION

Ablation - 250

Ablation and Temperature Sensors for Flight Measurements in Reentry Body Heat Shields - 153

Heat Transfer for Perfect Gas and Chemically Reacting Flows - 249

Lightweight Materials for Engines and Structures - 160

Radiative Heat Flux: Theoretical and Experimental Predictions for Titan Entry Probe - 20

Rotational and Vibrational Temperature and Density Measurements by Planar Laser Induced NO-Fluorescence Spectroscopy in a Nonequilibrium High Enthalpy Flow - 161

Thermal Loads and Protection Systems for Transitional and Shock Interaction Regions in Hypersonic Vehicle Design - 88

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

Wind tunnel flutter testing on shingles in the transonic and supersonic speed regime - 11

THERMAL SHOCK

Instrumented Service Life Program for the Pictor Rocket Motor - 183

Thermal Fatigue: A Useful Tool to Assess Low Cycle Fatigue Damage in Superalloys for Components Experiencing Thermal Transients - 276

THERMAL STABILITY

Field repair materials for naval aircraft - 55

THERMAL STRESSES

Control and Mathematical Model of Transonic Wind Tunnels - 139

Elaboration of Cryogenic Transonic Short-Duration Wind Tunnel at ITAM - 140

Evaluating Analytically and Experimentally the Gas Dynamics of Transonic Wind Tunnels with Devices for Air Evacuation from Plenum Chamber - 141

Improving Transonic Wind Tunnel Compressor Operation by Means of Guide Vane Angle Optimization - 142

Measurement Techniques Developed for Cryogenic Field in T2 Transonic Wind Tunnel - 145

T2 Transonic Cryogenic Wind Tunnel at Toulouse - 136

The Impulse Transonic Wind Tunnel U-11: New Effective Technology for Generation of Sub-, Trans- and Supersonic Gas Flow - 140

The National Transonic Facility (NTF) Operational Status - 137

Turbulence and Noise Criteria and their Implementation in NWTC-Type Wind Tunnels - 142

Use of a Captive Trajectory System in a Wind Tunnel - 70

TRANSPONDERS

Simulation models for IFF system performance analysis - 42

TRANSPORT AIRCRAFT

A Review of Fire Related Accidents, 1985-1995 - 31

A Review of Recent Civil Air Transport Accidents/Incidents and their Fire Safety Implications - 31

Burnthrough Resistance of Fuselage and Cabin Structures - 35

Characterisation and Modelling of Aircraft Wake Based on Tests of Scaled Models in a Laboratory - 17

Description and Status of Civil Aviation's Halon Replacement Program - 33

Fire Safety and Fire Protection for Military Transport Aircraft as Addressed in a Recent NATO/AGARD Survivability Study - 31

Fire Safety Concept for a Modern Combat Aircraft - 33

Flight flutter tests of transport civil aircraft with an Electronic Flight Control System - 126

Flight Testing of Manual Flight Control Functions for a Small Transport Aircraft (Project ATTAS-SAFIR) - 128

Future Transport Aircraft (FTA): Tactical Transport Intermediate Range - 37

Interior Conditioning in Military Transport: Aircraft Certification - 34

Low-Level Flight Capability of a Future Military Transport Aircraft Based on Commercial Avionics - 101

On the Dynamics of Engine Jets Behind a Transport Aircraft - 76

Propulsion Considerations for an Advanced Vertical Take-Off and Landing (VTOL) Transport Aircraft - 113

Structure of a Transport Aircraft-Type Near Field Wake - 30

The Dynamic Response of a Twin-Engine, Commercial Jet Transport to Wake Vortex Encounters - 76

The effect of proof pressure testing on the retardation of multi-site damage - 63

TRANSPORT VEHICLES

Solid-state data recorder, next development and use - 264

TRANSPORTATION

An Analysis of Stress and Coping Factors on Air Crew During Emergency Medical Service (EMS) Helicopter Operations - 322

TRAPPED VORTICES

Dynamics of Vortices in Near-Wall Flows: Eigenfrequencies, Resonant Properties, Algorithms of Control - 253

TRAVELING WAVE AMPLIFIERS

Ultra-fast nonlinearities in semiconductor optical amplifiers for applications in all-optical networks - 374

TRAVELING WAVES

Substitution of Rolling for Slipping as an Effective Mechanism of Decreasing Hydrodynamic Drag - 250

TRENDS

Recent Advances in Particle Image Velocimetry - 256

Solid Rocket Motor Service Life Prediction Using Nonlinear Viscoelastic Analysis and a Probabilistic Approach - 184

Trends in Future Combat Aircraft Development - 367

US Environmental Trends and Issues Affecting Aerospace Manufacturing and Maintenance Technologies - 291

TRIBOLOGY

High Temperature Tribology for Future Diesel Engines - 271

Metallic and Non-Metallic Protection Systems for Reduction of Tribologic Influences in Several Areas on Tornado Aircraft - 167

The Reliability of the Bearings of Small and Medium Turbines Being More and More Dependent on Tribology - 271

Tribological Assessments and Concepts for an Oilfree Internal Combustion Engine - 271

Tribological Behaviour of Silicon Nitride-Based Ceramics - 166

Tribological Problems in Spacecrafts - 270

Tribology for Aerospace Systems - 269

TRINITROTOLUENE

Biodegradation of energetic compounds: Application to site restoration - 177

TROPOPAUSE

Advanced Small Turbopropulsion Engines - 113

TROPOSPHERE

Definition of a Communication System Using the Tropospheric Channel - 214

Lateral Resolution Considerations of Refractivity Profiles Associated with Remote Sensing Measurements of Over-Water Coastal Regions - 283

Lidar measurements of refractive propagation effects - 268

Tropospheric refractivity profiles inferred from low elevation angle measurements of Global Positioning System (GPS) signals - 291

TROPOSPHERIC SCATTERING

Evaluation of Coherence Bandwidth for Long Distance VHF/UHF Transmissions - 212

TUNABLE FILTERS

Remote Sensing by Active and Passive Optical Techniques - 283

TUNABLE LASERS

The Advantage of Using a Tunable Laser Source for Global Doppler Velocity Measurement - 257

TURBINE BLADES

A Review of the Research on Unsteady Turbine Blade Wake Characteristics - 105

A viscous-inviscid interaction model for rotor aerodynamics - 239

Damage Mechanism Assessment on Turbine Blades Superalloys Through TMF Tests - 104

Damage Mechanisms for Thermomechanical Fatigue of Aircraft Engines Materials - 104

Development of an Off-Design Loss Model for Transonic Compressor Design - 107

Effects of Cycle Type and Coating on the TMF Lives of CMSX6 - 276

Electron Beam Physical Vapour Deposition Thermal Barrier Coatings: A Comparative Evaluation of Competing Deposition Technologies - 170

Experimental and Numerical Investigation of Unsteady Flow Properties in a Stator of Multistage Axial Flow compressor - 108

Flow Predictions in Transonic Turbines Using Nonperiodic Grids - 107

Graded Design of EB-PVD Thermal Barrier Coating Systems - 171

Investigation of the yawed operation of wind turbines by means of a vortex particle method - 9

Laser-2-Focus Measurements on a Turbine Cascade with Leading Edge Film Cooling - 260

Polarization enhancement of contrast in infrared ship/background imaging - 373
- Leos, Melissa J.**
Visual System Operational Evaluation - 325
- Leporcq, B.**
The Advantage of Using a Tunable Laser Source for Global Doppler Velocity Measurement - 257
Use of Iodine Fluorescence Induced by Laser for Measurements of Pressure, Temperature, and Speed - 268
- Lepoutre, F.**
Application of Several Global Methods for Non Destructive Evaluation of Small Solid Propellant Motors - 180
- Leppert, F.**
Enhancing Spatial Situation Awareness in Helmet Mounted Displays: An Approach of Interest and Limitations Through Experimental Results - 319
Perceptual and Cognitive Synergy in Target Orientation: 3D Sound and Visual Information - 224
- Leppert, Franck**
A helmet mounted display for night missions at low altitude - 96
- Lequeux, L.**
Catapult-launching of the RAFALE design and experimentation - 58
- LeRoux, Y.**
The Influence of Antennas and Propagation on the Behavior of HF Digital Communications Links - 217
- LeRoux, Y. M.**
Decision Making Help in the Search for Clear Channels in the Decametric Band - 212
Multi-Port Digital Transmission System Using the Ionospheric Pathway - 217
- LeRoy, J.-F.**
The Advantage of Using a Tunable Laser Source for Global Doppler Velocity Measurement - 257
- Lesage, G. P.**
Photoinjector-driven chirped-pulsed free electron maser - 267
- Leschziner, M. A.**
Computational Modelling of Cascade-Blade Flow with Linear and Non-Linear Low-Re Eddy-Viscosity Models - 105
- Lesieur, M.**
Large-Eddy Simulations of Compressible Turbulent Flows - 249
- Lesleure, Daniel J.**
Carriage and Release Aerodynamics of the Pegasus (R) Air-Launched Space Booster - 70
Engineering-Level Methods for Carriage Loads, High Alpha Launch From Pitching Aircraft, and Submunition Aerodynamics - 70
- Lesleure, Teresa O.**
Carriage and Release Aerodynamics of the Pegasus (R) Air-Launched Space Booster - 70
- Leslie, Daniel**
TMD detection and tracking using improved AWACS sensors - 193
- Lesoinne, Michel**
Fast staggered algorithms for the solution of three-dimensional nonlinear aeroelastic problems - 350
- Lessard, L. B.**
Three-Dimensional Progressive Failure Analysis of Pin/Bolt Loaded Composite Laminates - 279
- Lessard, P.**
Evaluation of ammonium nitrate propellant emissions - 175
- Lestel, J. C.**
Ablation and Temperature Sensors for Flight Measurements in Reentry Body Heat Shields - 153
- Lestrade, Christian**
Analysis of Experimental Data for NCTR Target Modelling - 231
- Lesturgie, M.**
Nostramarine: A Concept of Multistatic Detection Adjusted to Surveillance of Low Altitude Targets - 262
- LeToan, Thuy**
Microwave Remote Sensing of Natural Targets: Theory and Experiment - 284
- LeToullec, L.**
Recent Ameliorations of the Code FLU3M for Calculating Compressible Flows - 246
- Lettington, A. H.**
Application of FTIR Spectroscopy to Measurement of Gas Turbine Engine Exhaust Emissions - 161
- Leung, Henry**
Multisensor data fusion for integrated maritime surveillance - 193
- Leushake, U.**
Graded Design of EB-PVD Thermal Barrier Coating Systems - 171
- Levaillant, D.**
Radar and Optronic Multiple Sensor System for Ground Attack - 234
- Levi, L. D.**
Evaluation of environmentally acceptable cleaners as replacements for methyl ethyl ketone and 1,1,1 trichloroethane in solid rocket motor production and maintenance applications - 177
- Levine, Jack**
NASA technology flight experiments program - 151
- Levine, Seymour**
AGARDograph on advanced astroinertial navigation systems - 40
- Levy, David**
Some Results from AGARD Study AAS-42: Potential Use of Commercial Satellite Systems for Military Applications - 285
- Levy, M. F.**
Fast PE models for mixed environments - 281
Modelling of Rough Surface Effects with the Matched Transform PE - 283
RCS Calculations with the Parabolic Wave Equation - 229
- Lewantowicz, Zdzislaw H.**
Deep integration of GPS, INS, SAR and other sensor information - 40
- Lewis, T. J.**
Distributed Architectures for Advanced Engine Control Systems - 116
- Lewke, E.**
Spatial Visuo-Motor Compatibility in a Tracking Task - 321
- Liamis, N.**
Numerical Simulations of Stator-Rotor Interactions of Compressor Blade Rows - 110
- Liang, D. F.**
A Practical Overview of Multiple Target Tracking Algorithms - 221
Air Defence Radar Surveillance System Tracking Assessment - 223
- Liang, David F.**
An overview of a generic multi-sensor integrated navigation system design - 40
An overview of Omega radio navigation system - 40
Multi-Sensor Multi-Target Data Fusion, Tracking and Identification Techniques for Guidance and Control Applications - 220
Representative vehicle implementation: Rotary wing aircraft - 41
- Liang, George**
UHF and Microwave Propagation Prediction in an Urban Environment - 209
- Lichtschlaeger, A.**
The Flight Orientation Trainer (FOT) as a Means of Evaluation and Validation of Psycho-Physical Load on Flying Personnel - 322
- Lichtschlager, A.**
The Flight Orientation Trainer as a Dual Purpose Device: Training Versus Aeromedical Research - 134
- Licina, J. R.**
First medical test of the UH-60Q and equipment for use in US Army medevac helicopters - 358

- System Design Considerations for Unmanned Tactical Aircraft (UTA) – 7
- System Implications and Innovative Applications of Satellite Navigation – 43
- Tactical Aerospace C3I in Coming Years – 203
- Technologies for Precision Air Strike Operations in Rapid-Reaction and Localized-Conflict Scenarios – 361
- Twenty-five Years of Contributions to Air Traffic Handling (Research, Development, Operations and History): A Bibliography – 42

PEP – Propulsion and Energetics Panel

- Active Combustion Control for Propulsion Systems – 161
- Advanced Aero-Engine Concepts and Controls – 112
- Advanced Non-Intrusive Instrumentation for Propulsion Engines – 192
- Aircraft Fire Safety – 30
- CFD Validation for Propulsion System Components – 255

Environmental Aspects of Rocket and Gun Propulsion – 172

Future Aerospace Technology in the Service of the Alliance, Volume 3 – 5

Impact Study on the Use of JET A Fuel in Military Aircraft During Operations in Europe – 178

Loss Mechanisms and Unsteady Flows in Turbomachines – 104

Propulsion and Energy Issues for the 21st Century – 271

Recommended practices for the assessment of the effects of atmospheric water ingestion on the performance and operability of gas turbine engines – 103

Service Life of Solid Propellant Systems – 178

Structural Assessment of Solid Propellant Grains – 154

SMP – Structures and Materials Panel

Advanced aeroservoelastic testing and data analysis – 63

Advanced Polymeric & Metallic Composite Materials for Space and Aerospace Vehicle Structures and Strength Optimization of Composite Structures and their Certification – 155

Aging Combat Aircraft Fleets: Long Term Applications – 85

Aluminum Alloy Forgings Property/Performance Attributes Focus: Fatigue and Durability Service Capabilities – 166

Bolted/Bonded Joints in Polymeric Composites – 190

Composite Repair of Military Aircraft Structures – 53

Corrosion detection and management of advanced airframe materials – 162

Environmentally Compliant Surface Treatments of Materials for Aerospace Applications – 190

Environmentally Safe and Effective Processes for Paint Removal – 188

Evaluation of loads from operational flight maneuvers – 72

Future Aerospace Technology in the Service of the Alliance, Volume 1 – 5

Integrated Airframe Design Technology – 95

Loads and Requirements for Military Aircraft – 4

Numerical Unsteady Aerodynamic and Aeroelastic Simulation – 6

POD assessment of NDI procedures using a round robin test – 274

Smart Structures and Materials: Implications for Military Aircraft of New Generation – 154

The Design, Qualification and Maintenance of Vibration-Free Landing Gear – 67

Thermal Barrier Coatings – 168

Thermal Mechanical Fatigue of Aircraft Engine Materials – 103

Tribology for Aerospace Systems – 269

Virtual Manufacturing – 347

Widespread Fatigue Damage in Military Aircraft – 61

SPP – Sensor and Propagation Panel

Digital Communications Systems: Propagation Effects, Technical Solutions, Systems Design – 208

Environmental Factors in Electronic Warfare Related to Aerospace Systems – 206

Future Aerospace Technology in the Service of the Alliance, Volume 2 – 4

High Power Microwaves (HPM), Volume 1 – 195

Multi-Sensor Systems and Data Fusion for Telecommunications, Remote Sensing and Radar – 387

Optical Processing and Computing – 343

Propagation Assessment in Coastal Environments – 199

Radar Signature Analysis and Imaging of Military Targets – 228

Remote Sensing: A Valuable Source of Information – 281

TIP – Technical Information Panel

An International Aerospace Information Network: IAIN – 383

Directory of Defence and Aerospace Information Centers – 382

Guide to multimedia storage – 382

Index of AGARD publications: 1992-1994 – 382

Introduction to Avionics Flight Test - 97
- ISBN 92-836-1046-6**
Bolted/Bonded Joints in Polymeric Composites - 190
- ISBN 92-836-1047-4**
Advances in Cryogenic Wind Tunnel Technology - 134
- ISBN 92-836-1048-2**
Precision Terminal Guidance for Munitions - 47
- ISBN 92-836-1049-0**
Impact Study on the Use of JET A Fuel in Military Aircraft During Operations in Europe - 178
- ISBN 92-836-1050-4**
Piloted Simulation in Low Altitude, High Speed Mission Training and Rehearsal - 134
- ISBN 92-836-1051-2**
Stick and Feel System Design - 127
- ISBN 92-836-1052-0**
Echocardiography in NATO Aircrew: A Multi-National Study - 301
- ISBN 92-836-1053-9**
Capsule Aerothermodynamics - 18
- ISBN 92-836-1054-7**
Propulsion and Energy Issues for the 21st Century - 272
- ISBN 92-836-1055-5**
Helicopter/Weapon System Integration - 4
- ISBN 92-836-1056-3**
Sonic Nozzles for Mass Flow Measurement and Reference Nozzles for Thrust Verification - 249
- ISBN 92-836-1057-1**
Turbulence in Compressible Flows - 248
- ISBN 92-836-1058-X**
Aerospace 2020 - 366
- ISBN 92-836-1059-8**
Aerospace 2020 - 7
- ISBN 92-836-1060-1**
Active Combustion Control for Propulsion Systems - 161
- ISBN 92-836-1061-X**
Advances in Soft-Computing Technologies and Application in Mission Systems - 346
- ISBN 92-836-1062-8**
Impact Head Injury: Responses, Mechanisms, Tolerance, Treatment and Countermeasures - 302
- ISBN 92-836-1063-6**
Structural Assessment of Solid Propellant Grains - 154
- ISBN 92-836-1064-4**
Air Traffic Management: Support for Decision Making Optimisation - Automation - 49
- ISBN 92-836-1065-2**
Aircraft Design Integration and Affordability - 93
- ISBN 92-836-1066-0**
Enhancement of Aircraft Ground Handling Simulation Capability - 95
- ISBN 92-836-1067-9**
Ice Accretion Simulation - 36
- ISBN 92-836-1068-7**
Injury Prevention in Aircraft Crashes: Investigative Techniques and Applications - 305
- ISBN 92-836-1069-5**
3-D Surface Anthropometry: Review of Technologies - 341
- ISBN 92-836-1070-9**
An International Aerospace Information Network: IAIN - 383
- ISBN 92-836-1071-7**
High Speed Body Motion in Water - 250
- ISBN 92-836-1072-5**
A Selection of Test Cases for the Validation of Large-Eddy Simulations of Turbulent Flows - 255
- ISBN 92-836-1073-3**
Thermal Barrier Coatings - 168
- ISBN 92-836-1074-1**
Aluminum Alloy Forgings Property/Performance Attributes Focus: Fatigue and Durability Service Capabilities - 166
- ISBN 92-836-1075-X**
CFD Validation for Propulsion System Components - 255
- ISBN 92-836-1076-8**
Wind Tunnel Wall Corrections - 25
- ISBN 92-836-1077-6**
A Designer's Guide to Human Performance Modelling - 342
- ISBN 92-836-1078-4**
Hypersonic Experimental and Computational Capability, Improvement and Validation - 262
- ISBN 92-836-2001-1**
Aerospace 2020 - 5
- ISBN 92-836-2002-X**
Aerospace 2020 - 146

14. Abstract <p>This volume provides abstracts and indexes for AGARD unclassified publications published during the period 1995-1998. Full bibliographical citations and abstracts for all the documents in this publication are given in the abstract section, which is organized in the major subject divisions and specific categories used by NASA in abstract journals and bibliographies. The subject divisions and categories are listed separately, together with a note for each that defines its scope and provides any cross-references. Category breaks in the abstract section are identified by category number and title, and a scope note. Within each category, the abstracts are arranged by document ID number.</p> <p>Six indexes — Subject (based on <i>NASA Thesaurus nomenclature</i>), Personal Author, Panel, Report Number, ISBN and Document ID Number — are included.</p> <p>This publication was sponsored by the Information Management Committee (IMC) of RTO, and compiled by NASA's Center for AeroSpace Information (CASI).</p> <p>This volume completes the series of paper indexes of AGARD publications for 1952-1998.</p>

DIFFUSION DES PUBLICATIONS

RTO NON CLASSIFIEES

L'Organisation pour la recherche et la technologie de l'OTAN (RTO), détient un stock limité de certaines de ses publications récentes, ainsi que de celles de l'ancien AGARD (Groupe consultatif pour la recherche et les réalisations aérospatiales de l'OTAN). Celles-ci pourront éventuellement être obtenues sous forme de copie papier. Pour de plus amples renseignements concernant l'achat de ces ouvrages, adressez-vous par lettre ou par télécopie à l'adresse indiquée ci-dessus. Veuillez ne pas téléphoner.

Des exemplaires supplémentaires peuvent parfois être obtenus auprès des centres nationaux de distribution indiqués ci-dessous. Si vous souhaitez recevoir toutes les publications de la RTO, ou simplement celles qui concernent certains Panels, vous pouvez demander d'être inclus sur la liste d'envoi de l'un de ces centres.

Les publications de la RTO et de l'AGARD sont en vente auprès des agences de vente indiquées ci-dessous, sous forme de photocopie ou de microfiche. Certains originaux peuvent également être obtenus auprès de CASI.

DISTRIBUTION OF UNCLASSIFIED

RTO PUBLICATIONS

NATO's Research and Technology Organization (RTO) holds limited quantities of some of its recent publications and those of the former AGARD (Advisory Group for Aerospace Research & Development of NATO), and these may be available for purchase in hard copy form. For more information, write or send a telefax to the address given above. **Please do not telephone.**

Further copies are sometimes available from the National Distribution Centres listed below. If you wish to receive all RTO publications, or just those relating to one or more specific RTO Panels, they may be willing to include you (or your organisation) in their distribution.

RTO and AGARD publications may be purchased from the Sales Agencies listed below, in photocopy or microfiche form. Original copies of some publications may be available from CASI.
